SEPARATION TECHNIQUES: CHROMATOGRAPHY

INTRODUCTION

CHROMATOGRAPHY IS AN IMPORTANT BIOPHYSICAL TECHNIQUE THAT ENABLES THE SEPARATION, IDENTIFICATION, AND PURIFICATION OF THE COMPONENTS OF A MIXTURE FOR QUALITATIVE AND QUANTITATIVE ANALYSIS. PROTEINS CAN BE PURIFIED BASED ON CHARACTERISTICS SUCH AS SIZE AND SHAPE, TOTAL CHARGE, HYDROPHOBIC GROUPS PRESENT ON THE SURFACE, AND BINDING CAPACITY WITH THE STATIONARY PHASE. FOUR SEPARATION TECHNIQUES BASED ON MOLECULAR CHARACTERISTICS AND INTERACTION TYPE USE MECHANISMS OF ION EXCHANGE, SURFACE ADSORPTION, PARTITION, AND SIZE EXCLUSION. OTHER CHROMATOGRAPHY TECHNIQUES ARE BASED ON THE STATIONARY BED, INCLUDING COLUMN, THIN LAYER, AND PAPER CHROMATOGRAPHY. COLUMN CHROMATOGRAPHY IS ONE OF THE MOST COMMON METHODS OF PROTEIN PURIFICATION.

Chromatography is based on the principle where molecules in mixture applied ontothe surface or into the solid, and fluid stationary phase (stable phase) is separating from each other while moving with the aid of a mobile phase. The factors effective on this separation process include molecular characteristics related to adsorption (liquid-solid), partition (liquid-solid), and affinity or differences among their molecular weights. Because of these differences, some components of the mixture stay longer in the stationary phase, and they move slowly in the chromatography system, while others pass rapidly into mobile phase, and leave the system faster . Based on this approach three components form the basis of the chromatography technique.

- Stationary phase: This phase is always composed of a "solid" phase or "a layer of a liquid adsorbed on the surface a solid support".
- Mobile phase: This phase is always composed of "liquid" or a "gaseouscomponent."
- Separatedmolecules

The type of interaction between stationary phase, mobile phase, and substances contained in the mixture is the basic component effective on separation of molecules from eachother.

Chromatography methods based on partition are very effective on separation. and identification of small molecules as amino acids, carbohydrates, and fatty acids. However,

•affinity chromatographies (ie. Ion-exchange chromatography) are more effective in the separation of macromolecules as nucleic acids, andproteins.

•Paper chromatography is used in the separation of proteins, and in studies related to proteinsynthesis;

• gasliquid chromatography is utilized in the separation of alcohol, esther, lipid, and amino groups, and observation of enzymatic interactions,while

• molecular-sieve chromatography is employed especially for the determinationof molecular weights of proteins.

• Agarose-gel chromatography is used for the purification of RNA, DNA particles, and viruses .

Stationary phase in chromatography, is a solid phase or a liquid phase coated on the surface of a solidphase.

• Mobile phase flowing over the stationary phase is a gaseous or liquidphase.

• If mobile phase is liquid it is termed as liquid chromatography (LC), and if it is gas then it is called gas chromatography(GC).

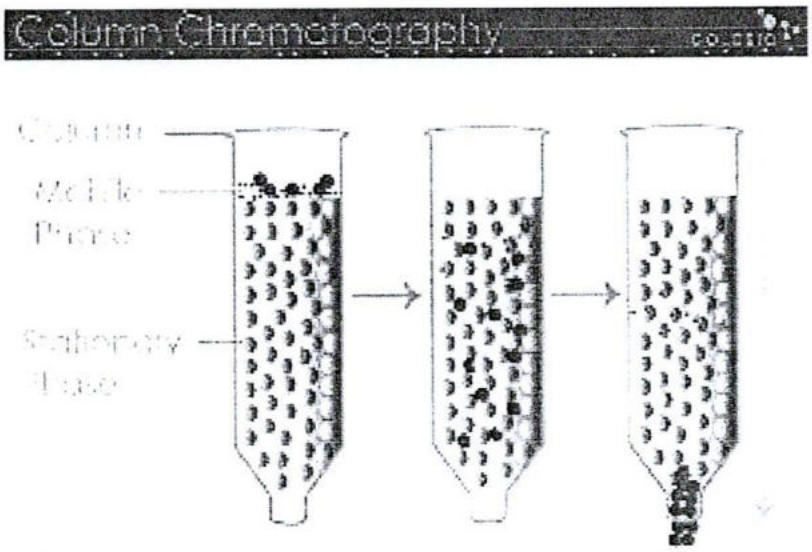

Gas chromatography is applied for gases, and mixtures of volatile liquids, and solid material. Liquid chromatography is used especially for thermal unstable, and non-volatile samples . The purpose of applying chromatography which is used as a method of quantitative analysis apart from its separation, is to achive a satisfactory separation within a suitable timeinterval. Various chromatography methods have been developed to that end. Some of them include column chromatography, thin-layer chromatography (TLC), paper chromatography, gas chromatography, ion exchange chromatography, gel permeation chromatography, high-pressure liquid chromatography, and affinity chromatography.

Types of chromatography

- Columnchromatography
- Ion-exchangechromatography
- Gel-permeation (molecular sieve)chromatography
- Affinitychromatography
- Paperchromatography
- Thin-layerchromatography
- Gaschromatography
- High-pressure liquid chromatography(HPLC)

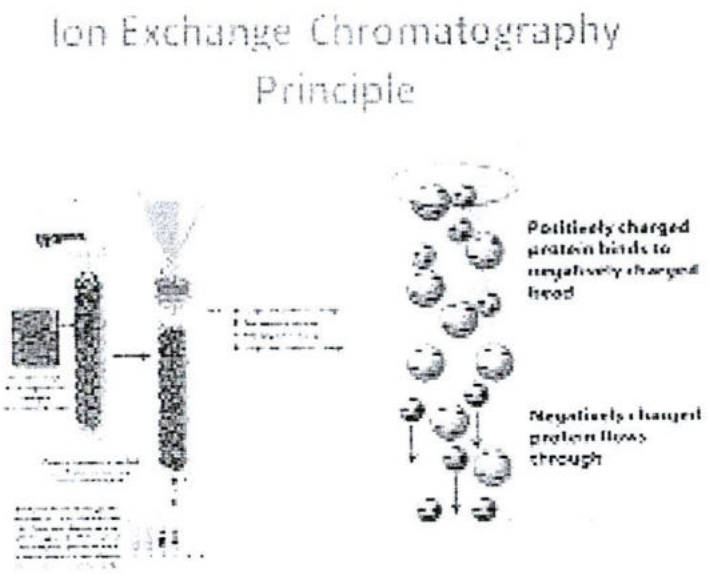

Column chromatography

Since proteins have difference characteristic features as size, shape, net charge, stationary phase used,and binding capacity, each one of these characteristic components can be purified using chromatographic methods. Among these methods,most frequently column chromatography is applied. This technique is used for the purification of biomolecules. On a column (stationary phase) firstly the sample to be separated, then wash buffer (mobile phase) are applied . Their flow through inside column material placed on a fiberglass support is ensured. The samples are accumulated at the bottom of the device in a time-, and volume-dependent manner.

Ion- exchange chromatography

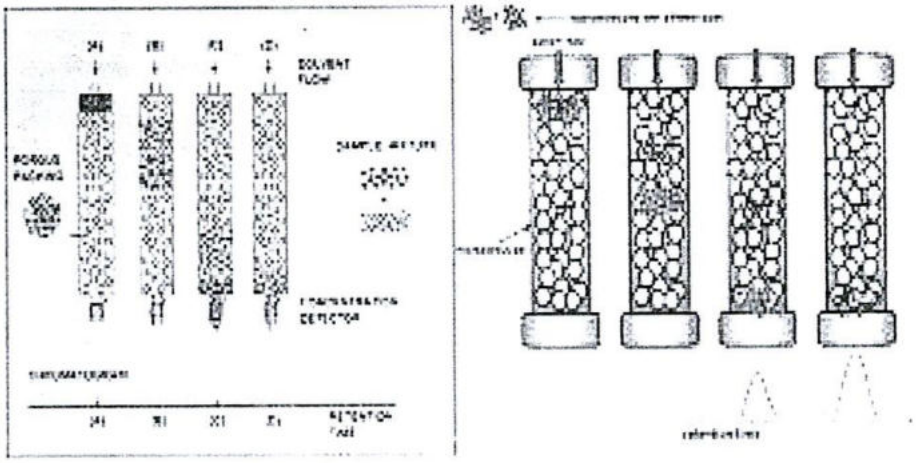

Ion- exchange chromatography is based on electrostatic interactions between charged protein groups, and solid support material (matrix). Matrix has an ion load opposite to that of the protein to be separated, and the affinity of the protein to thecolumn is achieved with ionic ties. Proteins are separated from the column either by changing pH, concentration of ion salts or ionic strength of the buffer solution . Positively charged ion-exchange matrices are called anion-exchange matrices, and adsorb negatively charged proteins. While matrices bound with negatively charged groups are known as cation-exchange matrices, and adsorb positively chargedproteins

Gel- permeation (molecular sieve) chromatography

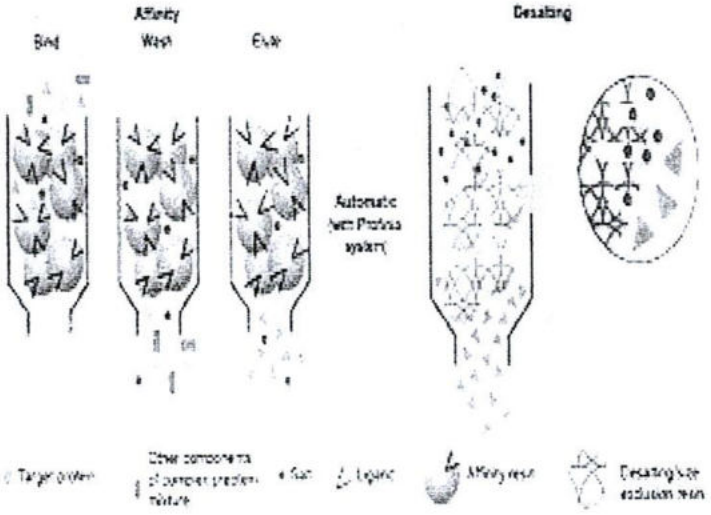

The basic principle of this method is to use dextran containing materials to separate macromolecules based on their differences in molecular sizes. This procedure is basically used to determine molecular weights of proteins, and to decrease salt concentrations of protein solutions . In a gel- permeation column stationary phase consists of inert molecules with small pores. The solution containing molecules of different dimensions are passed continuously with a constant flow rate through the column. Molecules larger than pores can not permeate into gel particles, and they are retained between particles within a restricted area. Larger molecules pass through spaces between porous particles, and move rapidly through inside the column. Molecules smaller than the pores are diffused into pores, and as molecules get smaller, they leave the column with proportionally longer retention times . Sephardic's G type is the most frequently used columnmaterial. Besides, dextran, agorose, polyacrylamide are also used as column materials

Gel Permeation Chromatography

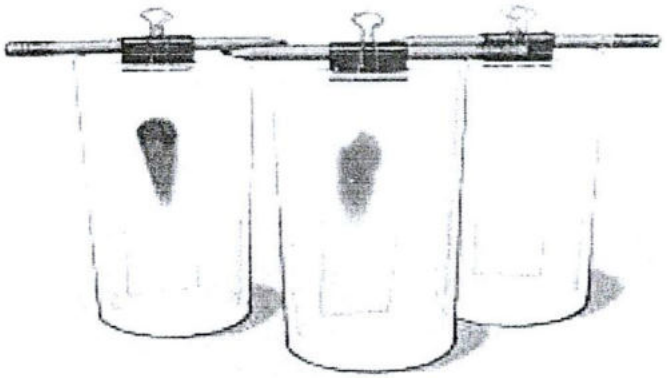

Affinity chromatography

This chromatography technique is used for the purification of enzymes, hormones, antibodies, nucleic acids, and specific proteins . A ligand which can make a complex with specific protein (dextran, polyacrylamide, cellulose etc) binds the filling material of the column. The specific protein which makes a complex with the ligand is attached to the solid support (matrix), and retained in the column,while free proteins leave thecolumn. Then the bound protein leaves the column by means of changing its ionic strength through alteration of pH or addition of a salt solution .

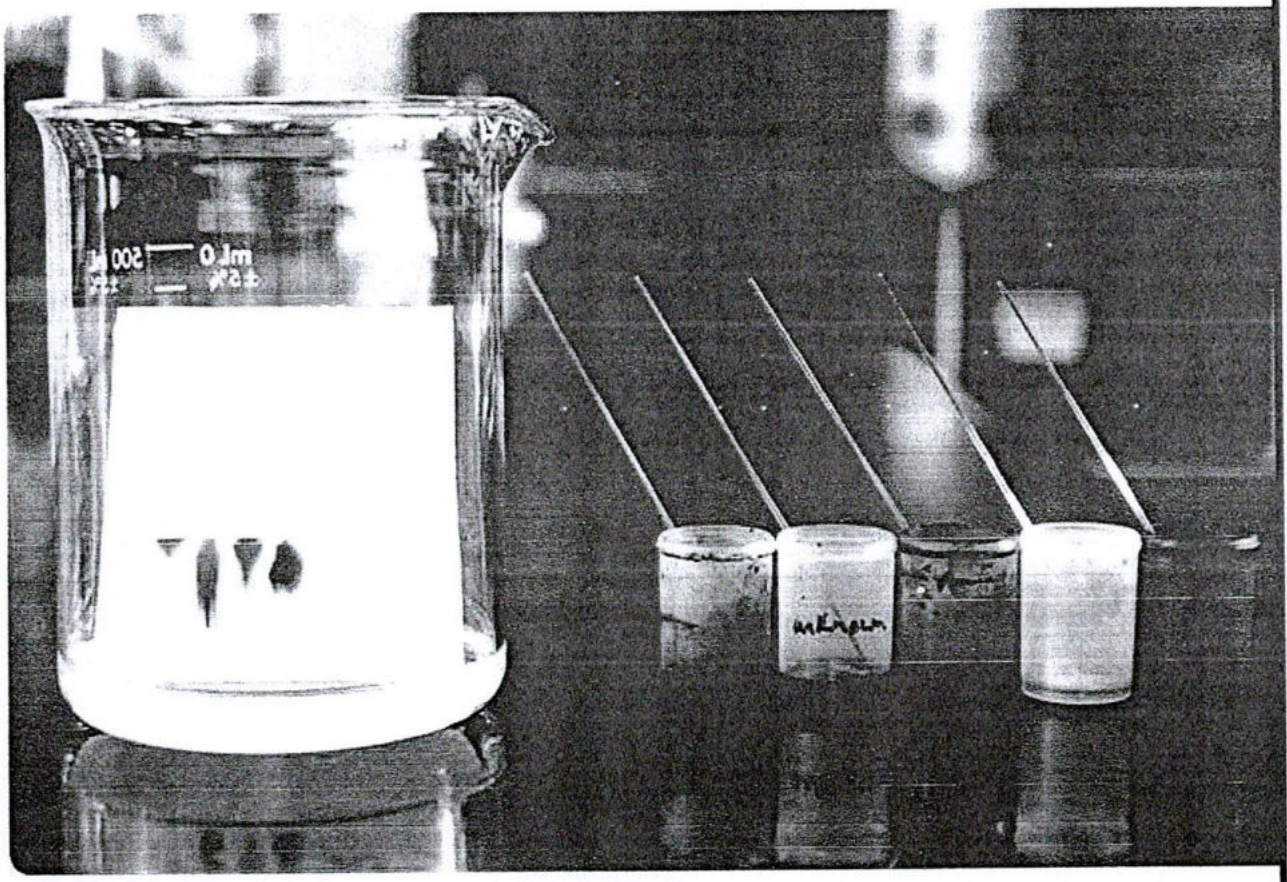

Paper chromatography

In paper chromatography support material consists of a layer of cellulose highly saturated with water. In this method a thick filter paper comprised the support, and water drops settled in its pores made up the stationary "liquid phase." Mobile phase consists of an appropriate fluid placed in a developing tank. Paper chromatography is a "liquid-liquid"chromatography

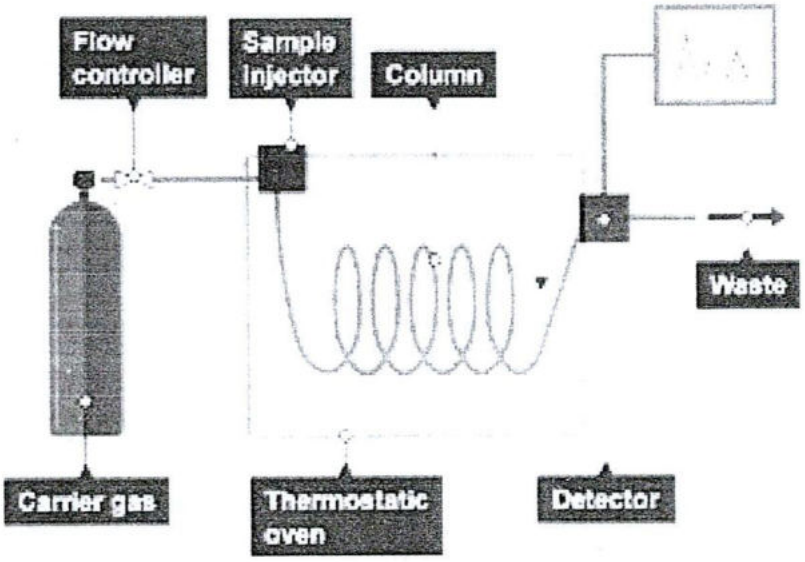

Thin-layer chromatography

Thin-layer chromatography is a "solid-liquid adsorption" chromatography. In this method stationary phase is a solid adsorbent substance coated on glass plates. As adsorbent material all solid substances used. In column chromatography (alumina,silica gel, cellulose) can be utilized. In this method, the mobile phase travels upward through the stationary phase The solvent travels up the thin plate soaked with the solvent by means of capillary action. During this procedure, it also drives the mixture priorly dropped on the lower parts of the plate with a pipette upwards with different flow rates. Thus the separation of analytes is achieved. This upward travelling rate depends on the polarity of the material, solid phase, and of the solvent . In cases where molecules of the sample are colorless, florescence, radioactivity or a specific chemical substance can be used to produce a visible coloured reactive product so as to identify their positions on the chromatogram. Formation of a visible colour can be observed under room light or UV light. The position of each molecule in the mixture can be measured by calculating the ratio between the the distances travelled by the molecule and the solvent. T his measurement value is called relative mobility, and expressed with a symbol Rf. Rf. Value is used for qualitative description of themolecules

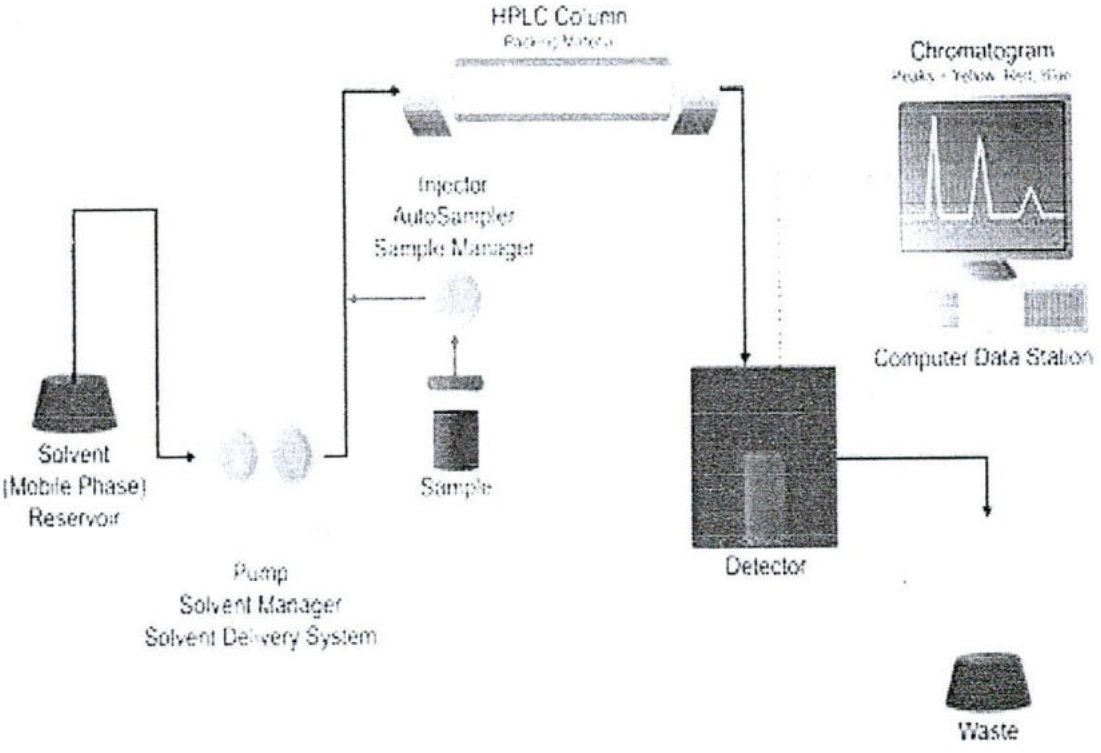

Gas chromatography

In this method stationary phase is a column which is placed in the device, and contains a liquid stationary phase which is adsorbed onto the surface of an inert solid. Gas chromatography is a "gas-liquid" chromatography. Its carrier phase consists of gases as He or N2. Mobile phase which is an inert gas is passed through a column under high pressure. The sample to be analyzed is vaporized, and enters into a gaseous mobile phase phase. The components contained in the sample are dispersed between mobile phase, and stationary phase on the solid support. Gas chromatography is a simple, multifaceted, highly sensitive, and rapidly applied technique for the extremely excellent separation of very minute molecules. It is used in the separation of very little amounts of analytes

High-prssure liquid chromatography (HPLC)

Using this chromatography technique it is possible to perform structural, and functional analysis, and purification of many molecules within a short time, This technique yields perfect results in the separation, and identification of amino acids, carbohydrates, lipids, nucleic acids, proteins, steroids, and other biologically active molecules. In HPLC, mobile phase passes through columns under 10–400 atmospheric pressure, and with a high (0.1–5 cm//sec) flow rate. In this technique, use of small particles,and application of high presure on the rate of solvent flow increases separation power, of HPLC and the analysis is completed within a short time. Essential components of a HPLC device are solvent depot, high- pressure pump, commerciallprepared column, detector, and recorder. Duration of separation is controlled with the aid of a computerized system, and material isaccrued

Application areas of chromatography in medicine

Chromatography technique is a valuable tool for biochemists, besides it can be applied easily during studies performed in clinical laboratories For instance, paper chromatography is used to determine some types of sugar, and amino acids in bodily fluids which are associated with hereditary metabolic disorders. Gas chromatography is used in laboratories to measure steroids, barbiturates, and lipids. Chromatographic technique is also used in the separation of vitamins, andproteins.

Conclusion

Initially chromatographic techniques were used to separate substances based on their color as was the case with herbal pigments. With time its application area was extended considerably. Nowadays, chromatography is accepted as an extremely sensitive, and effective separation method. Column chromatography is one of the useful separation, and determination methods. Column chromatography is a protein purification method realized especially based on one of the characteristic features ofproteins. Besides, these methods are used to control purity of a protein. HPLC technique which has many superior features including especially its higher sensitivity, rapid turnover rate, its use as a quantitative method, can purify amino acids, proteins, nucleic acids, hydrocarbons, carbohydrates, drugs, antibiotics, andsteroids.

Project Report On

"FOOD ADULTERATION"

SUBMITTED TO

Bachelor of Science in Chemistry

By

Miss. Jagadale Pallavi Rajesh *3324*
Miss. Jagtap Prajakta Shankar *3326*

UNDER THE GUIDENCE OF

Dr. V. P. Lad

Department of Chemistry
Yashwantrao Chavan College of Science, Karad.

Department of Chemistry

Yashwantrao Chavan College of Science, Karad.

(2018-2019)

Yashwantrao Chavan College of Science, Karad.

Department of Chemistry

CERTIFICATE

This is to certify that

Miss. Jagadale Pallavi Rajesh 3324

Miss. Jagtap Prajakta Shankar 3326

have successfully completed the Project On

"*Food Adulteration*"

for the partial fulfillment for the award of the degree of bachelor of Science in Chemistry under my supervision as per rules and regulations of Yashwantrao Chavan College of Science, Karad affiliated to Shivaji University, Kolhapur during the academic year 2018-2019. This works present bonafied work of the students.

DEPARTMENT OF CHEMISTRY

DECLARATION

This is to certify that,

Miss. Jagadale Pallavi Rajesh *3324*

Miss. Jagtap Prajakta Shankar *3326*

have submitted the Project entitled **"Food Adulteration"** *for the year 2018-2019. This project was carried out under my guidance and supervision.*

Dr. U. P. Lad

Project Guide

Place : Karad.

Date :

ACKNOWLEDGEMENT

I wish to convey my deep sense of gratitude to my project guide ***Dr. U. P. Lad, Assistant Professor,*** *Department of Chemistry, for his valuable guidance, keen interest, excellent suggestions and support during the course of this work.*

I also extend my sincere thanks to ***Dr. S. H. Burungale,*** *Head of Department of Chemistry for providing the laboratory facilities.*

My sincere thanks are due to ***Principal, Dr. S. B. Kengar*** *for his constant encouragement.*

I am especially thankful to the non-teaching members of this department for providing their valuable help in carrying out this Project work.

Finally I would like to thank those who have helped directly or indirectly in completion of this Project.

Name of Student	*Roll No.*

Exam Seat No. -
Roll No.- 3157, 3159

Date: 20-03-2019

Shri Shivaji Education Society Karad, Board for Higher Education's

YASHWANTRAO CHAVAN COLLEGE OF SCIENCE, KARAD

Vidyanagar, Karad – 415 124

AN ISO 9001:2015 CERTIFIED COLLEGE
Reg: RQ91/5237

Accredited at the B++ level by NAAC, Bangalore

Department of Pollution

This is to certify that Shri / Miss. Charan Rohit Abaso Jadhav Nilesh krishnat.

of B. Sc. III Pollution has completed Project work on

"To Study importances of Biogas"

satisfactorily prescribed by Shivaji University, Kolhapur as fulfillment of practical syllabus during the year 2018 - 2019.

Teacher In-charge Examiner Head. Incharge

Yashwantrao Chavan College of Science POLLUTION Karad

YASHWANTRAO CHAVAN COLLEGE OF SCIENCE, KARAD.

DEPARTMENT OF BIOTECHNOLOGY

LABORATORY CERTIFICATE

This is to certify that **Miss. Bhagwat Divya Dhondiram** has satisfactorily carried out the required project work prescribed by the Shivaji University, Kolhapur in practical course: project work for B.Sc. - III Biotechnology course (Opt) and his project work entitled "Biological Activity of Theraputical Potensial of *Algae Marmelos*" presents her bonafide work in B.Sc- III of the academic year 2019-2020

ACKNOWLEDGEMENT

I wish to convey my deep sense of gratitude to my project guide Miss. Thorat U. V., Assistant Professor, Department of Chemistry, for his valuable guidance, keen interest, excellent suggestions and support during the course of this work.

I also extend my sincere thanks to Dr. S. H. Burungale, Head of Department of Chemistry for providing the laboratory facilities.

My sincere thanks are due to Principal, Dr. S. B. Kengar for his constant encouragement.

I am especially thankful to the non-teaching members of this department for providing their valuable help in carrying out this Project work.

Finally I would like to thank those who have helped directly or indirectly in completion of this Project.

Introduction

The instrument used for determination for refractive index are called refract meter. The most common instrument used in abbe's refractometer. It's operation based on oritical angal of refraction being obtained in glass when the angle of incident in the liquid is almost 90^0.

The main part of refractometer are shos :

1) Mirror of refracted light from a frasted lamp or diffused sunlight into the instrument.
2) Prism box is in two prism box of flint glass (N=1 and more) are fixed in a wiged froms the prism can be pulled apart by opening the liquid whose refractive index is to be measured can be placed between two prism has one ground glass surface on which the lower liquid films is placed. It provides light incidient at all possible angles the appear prism has polished surface the whole of prism box can be rotated around horizontal axis in the vertical plane.

Theory :

When a ray of light passes from a rare to denser medium, it bends towards the normal at the interface. According to Snell's law of refraction. The refractive index of the liquids is given by ,

$$n = \frac{\text{Sin i}}{\text{Sin r}}$$

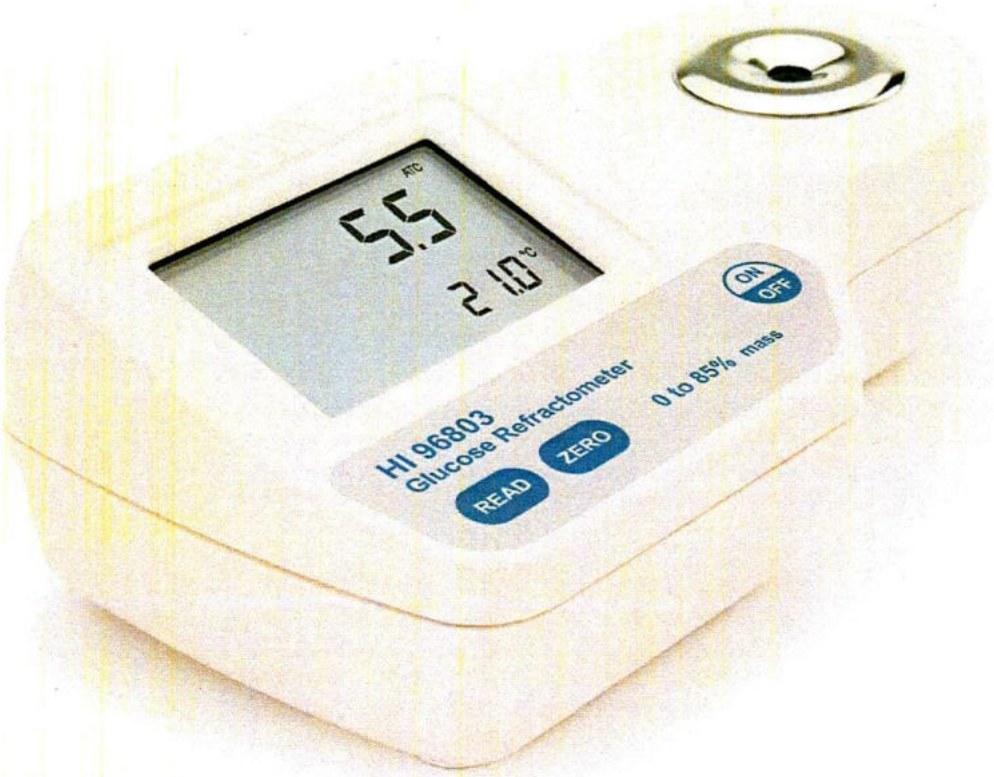

Refractometry follows the critical angle principle.

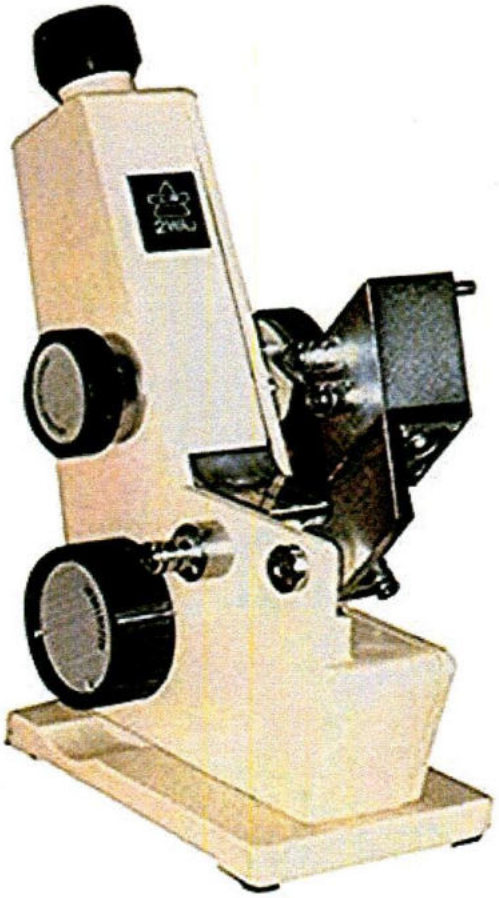

Critical Angle Principle :

When angle of incidence increases angle of refraction also increases and reaches to it is maximum value. When angle of incidence become 90^0 beyond the critical angle there will be completed darkness observed by means of an eyepiece refractive index depend on temperature but specific refractiveity of the substance.

Calibration of Refractometry :

Refractor can convinctly be calibrated by making of purified liquids such as water (n^{20} = D = 1.330) toluene (n^{20} D = 1.4969) and methyl cyclonexone (n^{20} = 1.4231). The national Bureals of standard supplies both lene and methyl cyclonexene as crertified samples with five decimal indicate at 20^0, 25^0 and 30^0 C and for each of seven wavelengths.

Determination of Glucose - D by using Refractometry

Appratus :

Refractometer, Glucose solution D-Glucose Acetone, Dropper etc.

Chemicals :

Glucose Solution, Acetone, Distilled water.

Procedure :

i) Preparation of solution of different concentrations. Determination of refractive index of the different solutions having different concentration. This solution is formed by the following process.

Take 62.50 gms of glucose and dissolve it into 250 ml distilled water by using volumetric flask. This solution is used to prepare different concentration of solution.

Take 40 ml., 30 ml., 20 ml. and 10 ml Solution of glucose and diluted against 50 ml. distilled water by (50 ml.) volumetric flask. This solution is used to determine the angle of rotation. similarly the given D. Glucose powder is taken in amount of 20 gms and diluted it

then take 25 ml of This D.glucose solution to 50 ml. diluted to from 20% of solution.

Determination of R.I. of different concentration and whose refractive index is to be measured can be placed between the two prism i.e. lower prism has one ground glass surface on which the liquid from is placed and observed the reading on the telescope and record the readings on the observation Table.

Chemical Reaction:

$$\underset{\text{Sucrose}}{C_{12}H_{22}O_{11}} + H_2O \xrightarrow{H^+} \underset{\text{Glucose}}{C_6H_{12}O_6} + \underset{\text{Fructose}}{C_6H_{12}O}$$

Observation Table :

	Volume 0.5 taken to prepare 50 ml. solution	Refractive index
Flask No. 1	Distilled Water	1.333
Flask No. 2	20 %	1.355
Flask No. 3	15 %	1.350
Flask No. 4	10 %	1.344
Flask No. 5	5 %	1.339
Flask No. 6	Unknown Solution	1.354

Calculations :

% of unknown sample from graph.

% of D- glucose = 19.50 x 100 / 20

% of D- Glucose = 1950/20

= 97.50 %

= 97.50 % of Glucose

Application of refractometry :

Refractometry has been employed for qualitative and quantitative analysis as well as for structural investigations.

Qualitative Analysis :

The identification of pure compounds can easily be carried out by combining pricise refraction index and dispersion data with other information, the specific data are of great importance when correlated with MP and BP elements analysis and spectroscopic evidence. Since the sensitivity of refractive index and dispersion depends upon the purity of sample in qualitative work considerable care must be taken in sample purification.

Dispersion measurement have also been applied in qualitative analysis for probable example important information regarding the probable prescience or absence of certain functional groups can be obtained by using Abbe refractometer.

Quantitative Analysis : for mixture of organic liquids linearity is more often observed when volume present in employed. It is intering tonote that

Pressure :

Refractive index of a substance increase with pressure because of accompanying increase in density the effect is more pronounced in gasses then in liquids for solids then effected is smaller then gasses and liquids.

Thus the vibration in atmospheric pressure is only important for precise work with gasses and form the more exact work with liquids and solids.

Optical Evaluations :

When a compound contains two or more double bonds in conjugate position such as -CH = CH - CH = Ch - the molecular refractivity has been found to be greater then that calculated this phenomenon is called optical exalation.

Optical exaltation also occurce if carbonyl group is present along with double or triple bond the observed value of molar refractivity for intense of Phorone is 45, 39 while the calculated value is $(CH_2)_2$ C= CH- CO - CH = C $(CH_3)_2$

9 x 2.42 + 14 x 1.10 +2 x 1.73 + 1 x 2.21 = 42.85

Thus optical exalation = 45.3 g - 42.85

= 2.54

There will be no optical exaltation, when there are no conjugated double bonds. e.g. the observed value of molequalar refractivity for di alkyl i.e.

CH_2 = CH - CH - CH_3 - CH = CH_2 is 28.77

While the calculated value is 29.04 both the values are nearly clouser to each other.

In quantitative analysis linearly is note that in not a requirement because a suitable calibration curve can always prepared.

The determination of concentration of aqsugar solution is the most important quantitative application of refradometry most of the sugar have about the same effect on the refractive index of an aqueous solution the procedure thus gives measure of total carbohydrates concentration.

Similarly the concentration of sulphur in unvalucansed rubber can also be determined by refractometry.

The evaluation of apparatus and method for separation such as distillation odsarption chromatography diffusion and extraction are another important application of refractometry.

Result :

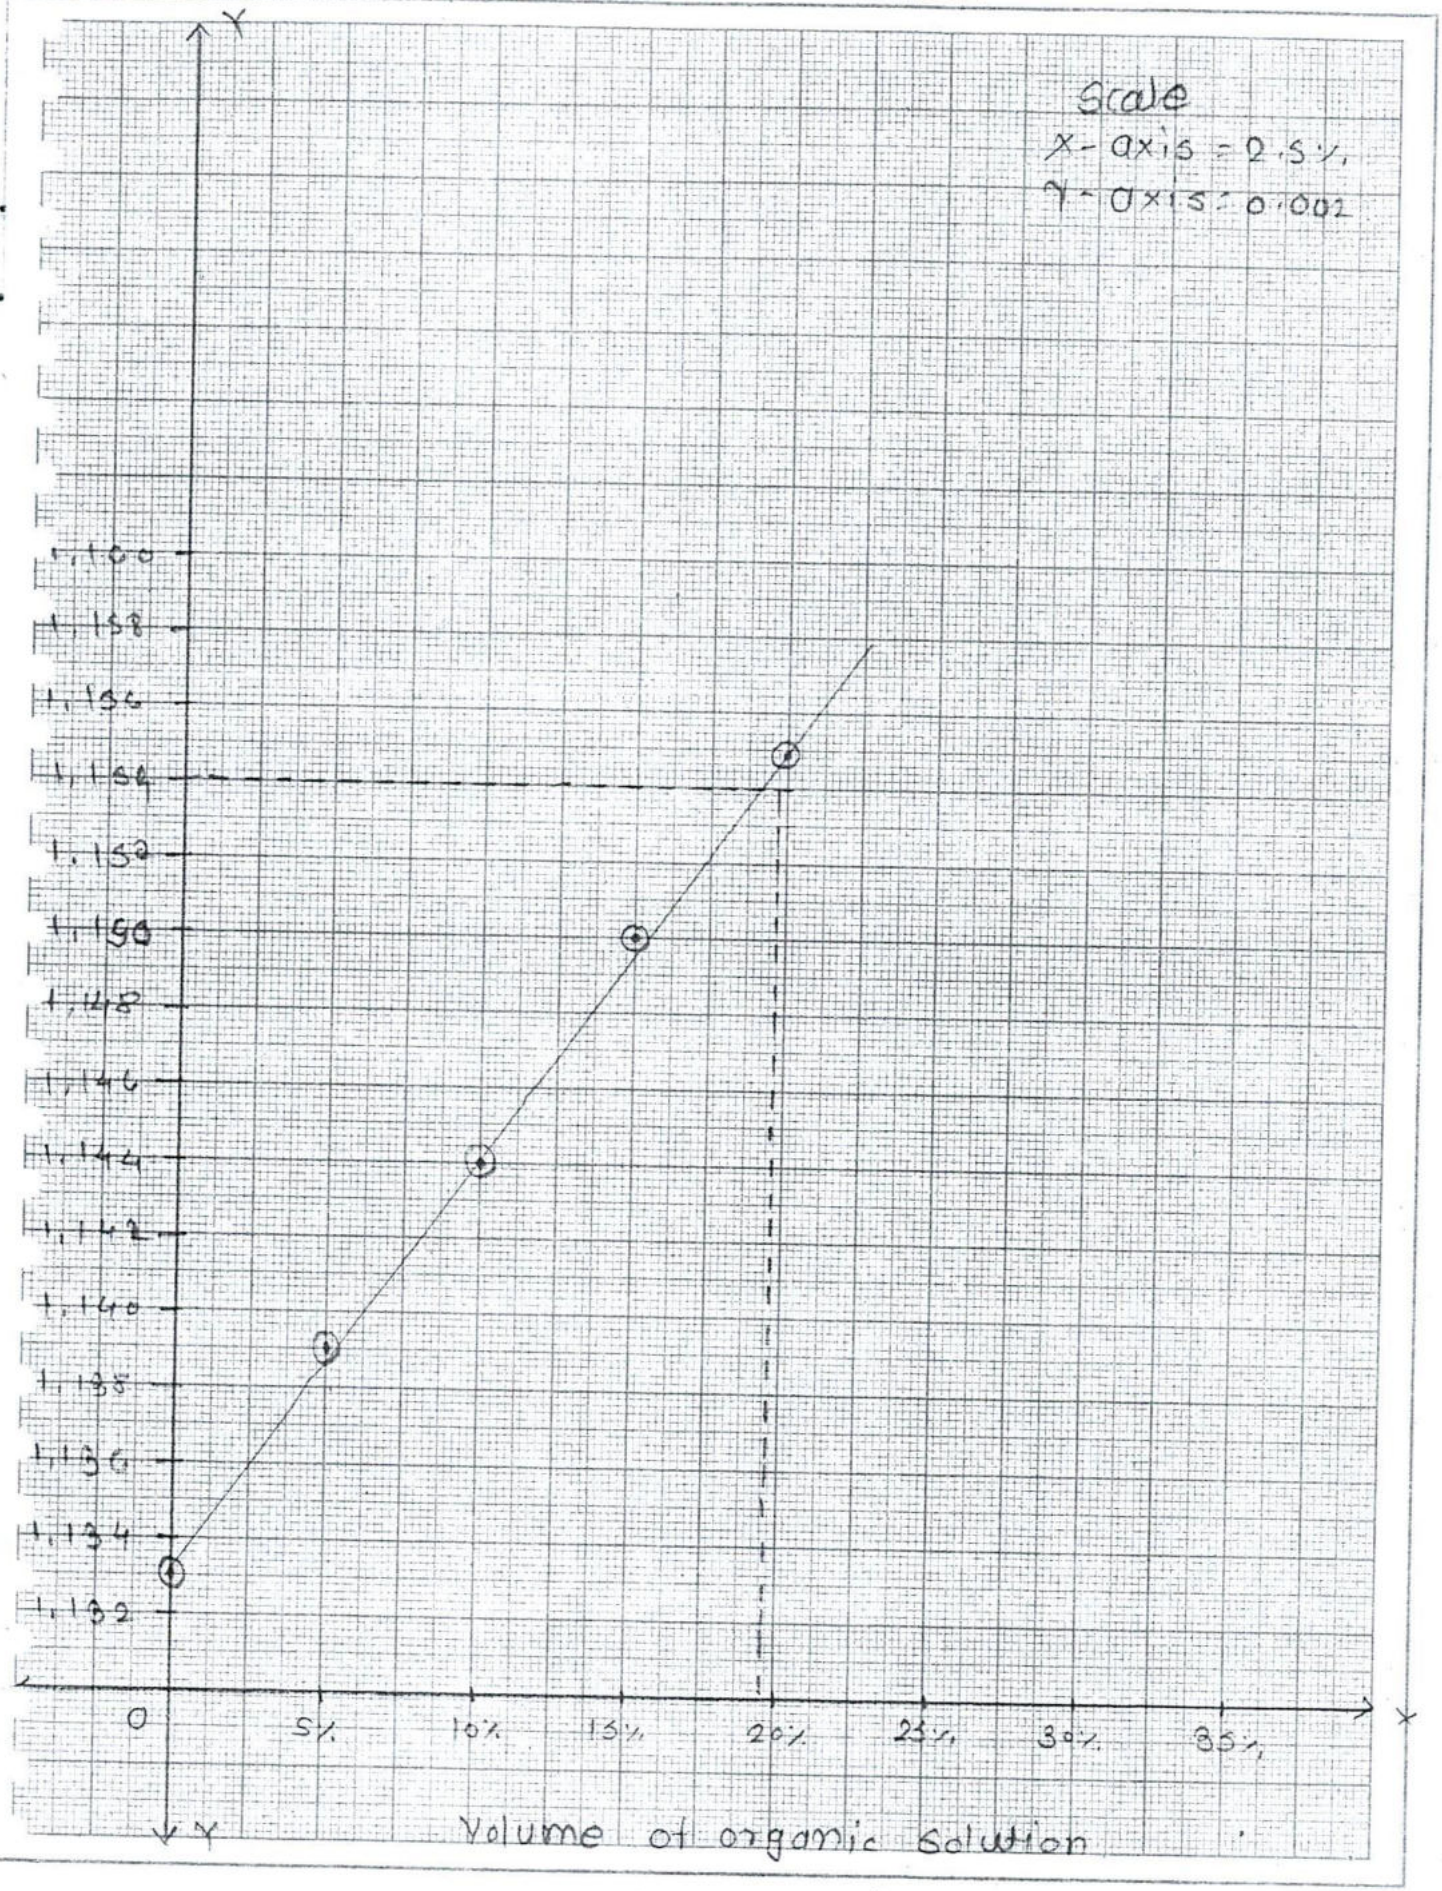

Percentage of Glucose = 97.50 %

Refractometry

Name :

Graph of :

Conclusion :

By experimental study we can say that the glucose is optically active. It rotates the plane polarised light.

To comparing with different concentration of glucose solution. To D-glucose with different concentration of glucose solution to D-Glucose solution it has found that in D-Glucose 98.25 % of pure Glucose.

ACKNOWLEDGEMENT

This project is obviously not only result of my work done but also many personalities have been directly involve and without whom this project repot completion would not have been possible.

It gives us a great pleasure to record our gratitude to project guide Miss. Bhosale M.B. for expert guidance, contractive criticism through provoking discussion and continuous inspiration throughout the course of project work.

We are also thankful to The Principle ,YashwantraoChavan College of science,Karadfor providing us chemistry laboratory for experimental work and needed support for this project.

Lastly We would like to thanks to all teaching staff of chemistry department for their kind co-operation and help. I also thanks to all our friends' their good will to completed this project.

Introduction

Vegetable juice (also referred as: Green Drink) is a juice drink made primarily of blended vegetables and also available in the form of powders.

Vegetable juice is often mixed with fruits such as apples or grapes to improve flavor. It is often touted as a low-sugar alternative to fruit juice,
although some commercial brands of vegetable juices use fruit juices as sweeteners, and may contain large amounts of sodium.

Our body needs important nutrients to support its healthy condition. That is why it is imperative that our food consumption should include healthy foods that contain good amount of nutrients sufficient enough to supply our body with its required daily nutrition. Nutrients like carbohydrates, proteins, fats, vitamins, minerals, etc. are play vital and specific role to develop and sustain body.

Drinking juice is an effective method to promote consumption of fruit and vegetables, and is very popular in many countries. Although the composition of fruits and vegetables is different from that of edible potion of fruits and vegetables they contain polyphenols, vitamins, and minerals fro fruits and vegetables. This project deals with finding out

various constituents and compositions of vegetables and fruits.

Analyzing the type of nutrient present in a food item helps plan a balanced diet. A balanced diet can be prepared according to the energy requirement which varies depending on age, sex, size, metabolic rate and activity level. In this project presence of Carbohydrates, Proteins. Fats and minerals are analyzed through different experiments. Following is a brief note on these nutrients

The presence of carbohydrates, proteins and fats in any food is detected by performing tests with the extract of the food. The vegetables and fruits are tested for these nutrients with the help of tests such as Molisch's Test, Fehling's Test, Tollen'sg test, etc. Test for minerals are also performed.

- **Nutrients**

A) Carbohydrate

The carbohydrates are the optically active polyhydroxy aldehydes or ketones or the compounds which produce such units on hydrolysis. Carbohydrates are the most common source of energy in living organisms. Foods high in simple carbohydrates include fruits, sweets and soft drinks. Foods high in complex carbohydrates include breads, pastas, beans, potatoes, bran, rice, and cereals. Carbohydrates are used as storage molecules as starch in plants and glycogens in animal.

➢ Role of carbohydrates in body is as follows:

1. Providing energy and regulation of blood glucose.
2. Biological recognition processes.
3. Dietary fiber.
4. Sparing the use of proteins for energy.
5. Breakdown of fatty acids and preventing ketosis.

B) Protein

Proteins (also known as polypeptides) are organic compounds made of amino acids arranged in a linear chain and folded into a globular form. Proteins are the basis of many animal body structures (e.g. muscles, skin, and hair). Each molecule is composed of amino acids, which are characterized by inclusion of nitrogen and sometimes sulphur (these components are responsible for the distinctive smell of burning protein, such as the keratin in hair). The body requires amino acids to produce new proteins (protein retention) and to replace damaged proteins. Protein contains 16.8 kilojoules (4 kilocalories) per gram. In the case of protein, this is somewhat misleading as only some amino acids are usable for fuel. Chief sources of protein are milk, meat, fish,etc.

C) Fat

A molecule of dietary fat typically consists of several fatty acids (containing long chains of carbon and hydrogen atoms), bonded to a glycerol. They are typically found as triglycerides (three fatty acids attached to one glycerol backbone). Fats may be classified as saturated or unsaturated depending on the detailed structure of the fatty acids involved. Fats contain 37.8 kilojoules (9 kilocalories) per gram.

D) Minerals

Dietary minerals are the chemical elements required by living organisms, other than the four elements carbon, hydrogen, nitrogen, and oxygen that are present in nearly all organic molecules.

1. **Calcium** - A common electrolyte, but also needed structurally (for muscle and digestive system health, bone strength, some forms neutralize acidity) may help clear toxins, provides signaling ions for nerve and membrane functions.
2. **Magnesium** - Required for processing ATP and related reactions (builds bone, causes strong peristalsis, increases flexibility, increases alkalinity)
3. **Phosphorus** - Required component of bones; essential for energy processing prevent anemia

• Importance of fruits and vegetable juices:

1. Tomato juice is known for anti-ageing.

2. Tomato contains an enzyme contain lycopene, that is useful to control prostate cancer.

3. Kiwi regulate blood pressure due to presence of potassium.

4. Apple helps to release toxin from the body and thereby improves the digestion.

5. Pomegranate juice is rich in vitamin A,C,and E.

6. Strawberry it known for skin cleansing juice. So to minimise the impacts of pimples and wrinkles, etc.

7. Orange juice helps to clear the blockages and enhances the heart function.

8. Mango juice helps to cleanse blood . It also act as dis-infectants.

Determine the presence of carbohydrates, proteins, fats and minerals in vegetable juices.

Apparatus

1. pH paper
2. Funnel
3. Boiling Tube
4. Burner

Chemicals

1.Vegetable Juice

2. Disodium Hydrogen Phosphate Solution (Na_2HPO_4)

3. Concentrated Nitric Acid (conc.HNO_3)

4. Iodine Solution

5. Tehling's Solution A& B

6. Ammonium Chloride Solution(NH_4OH)

7. Ammonium Hydroxide Solution(NH_4OH)

8. Ammonium Oxalate Solution$(NH_4)_2(C_2O_4)$

9. Picric Acid($C_6H_3N_3O_7$)

10. Sodium hydroxide solution (NaOH)

11. Copper Sulphate Solution ($CuSO_4$)

12. Disodium hydrogen phosphate solution (Na_2HPO_4)

13. Concentrated Nitric Acid (Conc. HNO_3)

- **Procedure**

The vegetable juices are diluted using distilled water. The distilled water is added to it in order to remove color and to make it colorless so that color change can be easily watched and noted down. Now test for food substance is taken down with the solution.

1. Test For Acidity – Take 5ml of juice in a test tube and pH values should be noted down by dipping it in the test-tube. If it turns red, it means that the juice is acidic else it is basic..

2. Test For Starch – Take 2ml of vegetable juice in a test tube, and add a few drops of iodine solution to it. If the solution turns blue in color it indicates the presence of starch.

3. Test for Proteins – Take 5ml of 5% of NaOH solution and add 2 drops of CusO4 known as burial solution and add juice and shake well. If the solution turns violet in color it indicates the presence of proteins.

4. Test For Carbohydrates – Take 2ml of Tehling's solution A and B and 1ml of Tehling's solution B in a Test tube. If the solution turns red it indicates the presence of sugar like maltose, glucose, fructose and lactose.

5. Test For Potassium – Add 2ml of juice in a test tube and picric acid, yellow color precipitate indicates the presence of potassium.

6. Test For Calcium – Add 2 ml of vegetable juice and add **NH4Cl** solution. Filter the solution and to the filtrate add 2 ml of ammonium oxalate solution. White precipitate indicates the presence of calcium.

7. Test for Magnesium – Add NH4OH and excess Disodium Hydrogen Phosphate to test tube with a glass rod. White precipitate indicates the presence of magnesium.

Sample - I

- **Cucumber**

Salient features:

Cucumber (Cucumis sativus) is a widely cultivated plant in the gourd family, Cucurbitaceous. It is a creeping vine that bears cylindrical fruits that are used as culinary vegetables. There are three main varieties of cucumber: slicing, pickling, and burpless. Within these varieties, several different cultivars have emerged.

The cucumber is originally from Southern Asia, but now grows on most continents. Many different varieties are traded on the global market.

The cucumber is a creeping vine that roots in the ground and grows up trellises or other supporting frames, wrapping around supports with thin, spiraling tendrils. The fruit of the cucumber is roughly cylindrical, elongated with tapered ends, and may be as large as 60 centimeters (24 in) long and 10 centimeters (3.9 in) in diameter.

Having an enclosed seed and developing from a flower, botanically speaking, and cucumbers are classified as pepoes, a type of botanical berry. Much like tomatoes and squash they are often also perceived, prepared and eaten as vegetables. Cucumbers are usually more than 90% water.

- **Observation Table**

Test	Observation	Inference
Acid /Base	pH Turns Red	Acidic
Starch	No Blue Colour	Absence of Starch
Protein	No Violet Colour	Absence of Protein
Carbohydrate	Red colour	Presence of carbohydrate
Potassium	No Yellow Precipitate	Absence of potassium
Calcium	White Precipitate	Absence Of Calcium
Magnesium	White precipitate	Presence of Magnesium

Sample - II

- Carrot

Sailent Feature:

The Carrot (Dacus carota sativus) is a root vegetable, usally orange in colour, though purple, red, white, and yellow varieties exist. It has a crisp texture when fresh. The most commonly eaten part of a carrot is a taproot, although the greens are sometimes eaten as well. It is a domesticated form of the wild carrot Daucus carota, native to Europe and southwestern Asia. The domestic carrot has been selectively bred for its greatly enlarged and more palatable, less woody-textured edible taproot.

The Food and Agriculture Organization of the United Nations (FAO) reports that world production of carrots and turnips (these plants are combined by the FAO for reporting purposes) for calendar year 2011 was almost 35.658 million tones. Almost half were grown in China. Carrots are widely used in many cuisines, especially in the preparation of salads, and carrot salads are a tradition in many regional cuisines.

- **Observation Table**

Test	Observation	Inference
Acid /Base Starch Protein Carbohydrate	pH Turns Red No Blue Colour No Violet Colour Red colour	Acidic Presence of Starch Absence of Protein Presence of carbohydrate
Potassium	Yellow Precipitate	Presence of potassium
Calcium	No White Precipitate	Absence Of Calcium
Magnesium	No White precipitate	Absence of Magnesium

Sample - III

- **Tomato**

Salient Features:

The tomato (etymology and pronunciation) is the edible, often red fruit/berry of the nightshade Solanum lycopersicum, commonly known as a tomato plant. The tomato is consumed in diverse ways, including raw, as an ingredient in many dishes, sauces, salads, and drinks. While it is botanically a berry fruit, it is considered a vegetable for culinary purposes, which has caused some confusion.

The species originated in the South American Andes and its use as a food originated in Mexico, and spread throughout the world following the Spanish colonization of the Americas. Its many varieties are now widely grown, sometimes in greenhouses in cooler climates. The plants typically grow to 1–3 meters (3–10 ft) in height and have a weak stem that often sprawls over the ground and vines over other plants.

It is a perennial in its native habitat, although often grown outdoors in temperate climates as an annual. An average common tomato weighs approximately 100 grams (4 oz).

- Observation Table

Test	Observation	Inference
Acid /Base Starch Protein Carbohydrate	pH Turns Red No Blue Colour No Violet Colour Red colour	Acidic Presence of Starch Absence of Protein Presence of carbohydrate
Potassium	Yellow Precipitate	Presence of potassium
Calcium	White Precipitate	Presence Of Calcium
Magnesium	No White precipitate	Absence of Magnesium

Result

After performing the tests for carbohydrates, proteins, fats and minerals, following can be concluded about their presence in different vegetables.

2. Tomato contains carbohydrates, proteins, calcium, magnesium.

3. Cucumber contains carbohydrates, proteins, fats, calcium, magnesium, iron.

4. Carrot contain starch, carbohydrates & potassium.

- **Conclusion:**

. From the table given behind it can be conducted that most of the fruits and vegetables contain carbohydrate and vegetable contain carbohydrate to small extent. Proteins are present in small quantity. Carbohydrates and starch are rich in tomato and cucumber. Therefore one must not only depend on fruits and vegetables for a balanced diet.

ACKNOWLEDGEMENT

I wish to convey my deep sense of gratitude to my project guide **Ankush mali sir,** Assistant Professor Department of Chemistry for his valuable guidance, keen interest, excellent suggestions and support during the course of this work.

I also extend my sincere thanks to Dr S. H. Burungale Associate Professor and Head of the Department of Chemistry forproviding the laboratory facilities.

My sincere thanks are due to Principal Dr. S. B. Kengar for his constant encouragement.

I am especially thankful to the non-teaching members of this department for providing their valuable help in carrying out this project work.

Finally I would like to thank those who have helped directly or indirectly in completion of this project.

CHAPTER 1 INTRODUCTION

1.1 OVERVIEW

Soaps are cleaning agents that are usually made by reacting alkali (e.g., sodium hydroxide) with naturally occurring fat or fatty acids. The reaction produces sodium salts of these fatty acids, which improve the cleaning process by making water better able to lift away greasy stains from skin, hair, clothes, and just about anything else. As a substance that has helped clean bodies as well as possessions, soap has been remarkably useful.

Soap is a salt of a fatty acid used in a variety of cleansing and lubricating products. In a domestic setting, soaps are usually used for washing, bathing, and other types of housekeeping. In industry, soaps are used as thickeners, components of some lubricants, and precursors to catalysts. When used for cleaning, soap solubilizes particles and grime, which can then be separated from the article being cleaned. Where soaps act as surfactants, emulsify oils to enable them to be carried away by water. Soap is created by mixing fats and oils with a base, as opposed to detergent which is created by combining chemical compounds in a mixer.

Soap cleans very well in soft water. It is not toxic to water life. It can be broken down by bacteria. However, it is slightly soluble in water, so it is not often used in washing machines. It does not work well in hard water. It cannot be used in strongly acidic solutions. Mild hand soaps are only basic enough to remove unwanted skin oils. For other forms of oil, dishwashing soap is strong enough to remove almost all forms of oil without damaging petroleum products such as plastics. It does not damage skin either.

Soap can be produced by a simple process called saponification that takes place when a fatty acid comes in contact with an alkali. When fats or oils, which contain fatty acids, are combined with a strong alkali, the alkali first splits the fats or oils into fatty acids and glycerine. After that, the sodium or potassium part of the alkali joins with the fatty acid part of the fat or oils. This mixture is called soap or the potassium or sodium salt of the fatty acid. So, soap is a cleansing agent created by the combination of fats and oils with an alkaline base.

1.1 HISTORY OF SOAP

Although no one really knows when soap was discovered, there are various legends surrounding its beginning. The discovery of soap predates recorded history, going back perhaps as far as six thousand years.

According to Roman legend, soap was named after Mount Sapo, an ancient site of animal sacrifices. After an animal sacrifice, rain would wash animal fat and ash and that was collected under the ceremonial altars, down to the banks of the Tiber River. Women washing clothes in the river noticed that if they washed their clothes in certain parts of the river after a heavy rain their clothes were much cleaner. This is the emergence of the first soap or at least the first use of soap.

A soap-like material found in clay cylinders during the excavation of ancient Babylon is evidence that soap making was known as early as 2800 B.C. Inscriptions on the cylinders say that fats were boiled with ashes, a soap-making method. By the second century A.D., the Greek physician, Galen, recommended soap for both medicinal and cleansing purposes. Bathing habits all over Europe rose and declined with Roman civilization. When Rome fell in 467 A.D., so did bathing. It is believed that the lack of cleanliness and poor living conditions contributed to the many plagues of the middle Ages.

In the early beginnings of soap making, it was an exclusive technique used by small groups of soap makers. The demand for soap was high, but it was very expensive and there was a monopoly on soap production in many areas. Over time, recipes for soap making became more widely known, but soap was still expensive. Back then, plant by products and animal and vegetable oils were the main ingredients of soap. The price of soap was significantly reduced in 1791 when a Frenchman by the name of LeBlanc discovered a chemical process that allowed soap to be sold for significantly less money.

1.2 SAPONIFICATION OF SOAP

The basic structure of all soaps is essentially the same, consisting of a long hydrophobic (water-fearing) hydrocarbon "tail" and a hydrophilic (water-loving) anionic "head":

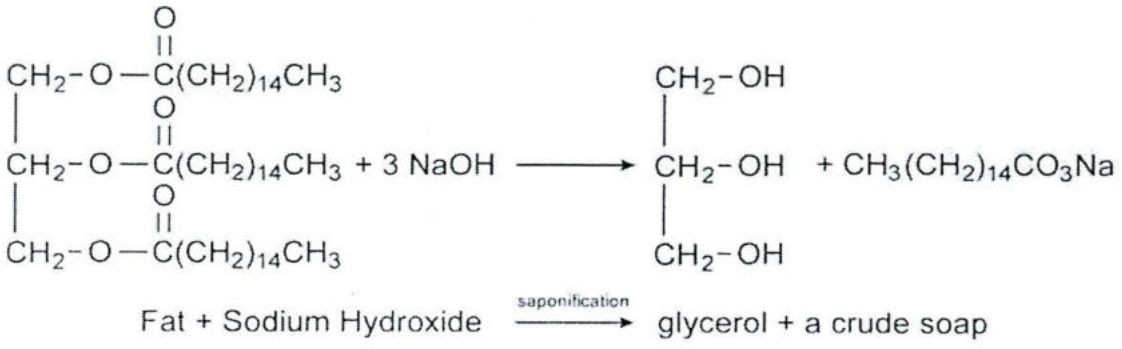

The length of the hydrocarbon chain ("n") varies with the type of fat or oil but is usually quite long. The anionic charge on the carboxylate head is usually balanced by either a positively charged potassium (K^+) or sodium (Na^+) cation.

Saponification is a process by which triglycerides are reacted with sodium or potassium hydroxide to produce glycerol and fatty acid salt called "soap". The triglycerides are most often animal fats or vegetable oils. When sodium hydroxide is used, a hard soap is produced. Using potassium hydroxide results in a soft soap.

Saponification Example: Lipids that contain fatty acid ester linkages can undergo hydrolysis. This reaction is catalysed by a strong acid or base. Saponification is the alkaline hydrolysis of the fatty acid esters. The mechanism of saponification is:

1. Nucleophilic attack by the hydroxide
2. Leaving group removal
3. Deprotonation

The chemical reaction between any fat and sodium hydroxide is a saponification reaction.

1.3 TYPES OF SOAP

There are many types of soaps, depending upon the usage. There are hard and soft, and everything in-between soaps. Hardness of soap is often achieved through the addition of hardening agents, so many natural soaps tend to be softer.

- **Kitchen Soap**: Kitchen soap is soap intended for use in the kitchen mainly to serve the purpose of dish-washing. They are further categorized into two: cleansers and detergents.
  - **Cleansers:** Cleansers are often made with mild abrasives and they are formulated to eliminate heavy oil or solid particles and hard-to-remove stains. The cleansers come in many different types depending on the type of abrasives they contain.
  - **Detergents:** Dish detergents are made to remove tough grease and release the solid dirt particles in the foam that is produced by the detergent. There are two types of dish detergents: machine dishwasher detergents and hand dishwashing detergents.
- **Laundry Soap**: Effective in cleaning solid particles, grease and organic compound in clothes and can be quite convenient to wash clothes during travels because it is easy to carry.
- **Novelty Soap**: Soap that comes in various shapes colors such as fish, cake, and moustache. Novelty soap serves more than a cleaning soap. It provides enjoyment and amusement to the children who use them.
- **Guest Soap**: Mini soap, generally smaller than the usual soap bar and comes with various attractive shapes. Designed for guest's usage.
- **Medicated Soap**: Medicated soap is soap with added antiseptics and disinfectants to kill bacteria.
- **Beauty Soap**: Beauty Soap features fragrance and ingredients for different skin types. They can feature special oil blend or glycerine.

1.4 USES OF SOAP:

Although the popularity of soap has declined due to superior detergents, one of the major uses of animal tallow is still for making soap, just as it was in years past. Beyond its cleaning ability, soap has been used in other applications. For example, certain soaps can be mixed with gasoline to produce gelatinous napalm, a substance that combusts more slowly than pure gasoline when ignited or exploded in warfare.

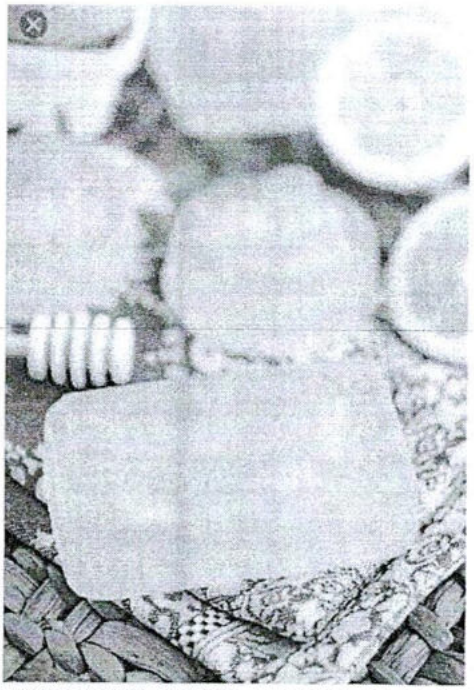

Soaps are also used in "canned heat," a commercialized mixture of soap and alcohol that can be ignited and used to cook foods or provide warmth. Overall, soap is a remarkably useful substance, just as it has been for thousands of years.

1.7 LITERATURE REVIEW

There has been number of studies done for saponification reaction for preparation of Soap. Notable ones are listed below:

Sr. No.	REFERENCE	OIL USED FOR ANALYSIS
1	A. A. Warra [1](2010)	Coconut oil
2	K. Cable [2](2015)	Coconut oil
3	A. G. Aaron	Palm oil and coconut oil

CHAPTER 2

BENEFITS OF NATURAL LIME SOAP

- Lemon soap has an antibactrical quality that helps to cleaning the skin and getting rid of bacteria. It helps to stay away from acne and pimples and keep skin healthy and soft. A good astringent will help to remove oil buildup, tighten up saggy skin, and prevent acne breakout.
- Lemon has purifying properties which clear the air, resulting in a clear and fresh environment. Lemon not only cleanse through direct application, but it also seemingly have positive effect on eradacting pollution in the air.

➢ **Soothes Burning effect**

Lemon gel is rich of vitamin C also been used for centuries as a natural way to treat sunburn. The cooling gel helps ease the symptoms of sore, tight skin and has been used successfully in tests involving first and second degree burns.

➢ **Moisturizes the Skin:**

Applied to the skin in cosmetics, natural soaps or even in its raw gel form, Aloe-Vera is moisturizing. Its emollient nature can help relieve dry, itchy skin and also promotes skin healing from conditions like psoriasis.

➢ **Repels Acne Bacteria:**

Naturally antimicrobial, lemon gel helps kills the bacteria responsible for acne

breakouts, also reducing the appearance of pimple scars with its skin lightening qualities.

➢ Facial cleanser

Some over-the-counter face washes have lemon extracts to enhance the cleansing properties of the products. If you're considering adding lemon oil extract to your own face washing routine, simply mix one drop of oil to a small amount of the wash in your hand before use.

Since lemon oil can potentially dry out your skin, you may want to try this method once a day to start. Discontinue using it entirely if you experience redness and irritation.

➢ LEMON OIL

- It cleanses your skin from deep within.
- Its fresh, citrusy aroma can rejuvenate and activate your mind.
- It's rich in vitamin C and antioxidants which fight off acne-causing germs.
- Its astringent properties reduce sebum and shrink large pores by acting a natural toner
- It brightens your skin and reduces blemishes and acne scars.
- Its fresh aroma lingers on your skin and keeps you refreshed all day!

CHAPTER 3

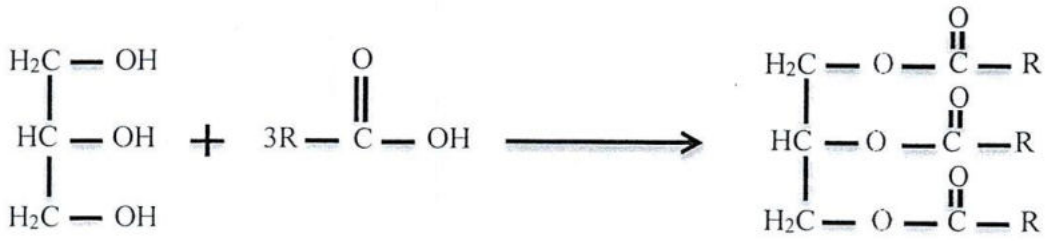

EXPRIMENTAL WORK

- **Aim:** To study saponification reaction for preparation of soap.

➢ **Theory:-**

- Oil or fat when treated with sodium hydroxide solution ,gets converted into sodium salt of fatty acid(soap) and glycerol .This reactions is known as saponification. The fatty acid of the glyceride is converted to sodium (or potassium) salt of the acid (soap) and glycerol is produced. For example, stearic acid reacts with sodium hydroxide to produce soap and glycerol.

➢ **Reaction:**

Glycerol Fats Triacylglycerol

➢ **Requirement** – Beaker, Stirrer, Burner, Soap mould, Weight balance,Lemon juice, Caustic soda, Coconut oil, glycerin

➢ **Procedure:**

- Take 20g of caustic soda and add 50g of water in it.
- Dissolve the caustic in water completely.

- Take 50g coconut oil in 500ml of beaker warm it.then add caustic soda and water solution in it with constant sterring for about 5 min.
- add 20 ml of glycerin in it then solution become transparent.
- Add 40ml Ethanol while sterring using glass rod
- Add lemon juice while sterrting
- Then transfer the solution into the soap mould. Let the soap harder by itself at normal room temperature. Then after approximately 30-40 minutes pull out that soap from mould very carefully. the soap base is finally ready.

CHAPTER 4

RESULT AND DISCUSSION

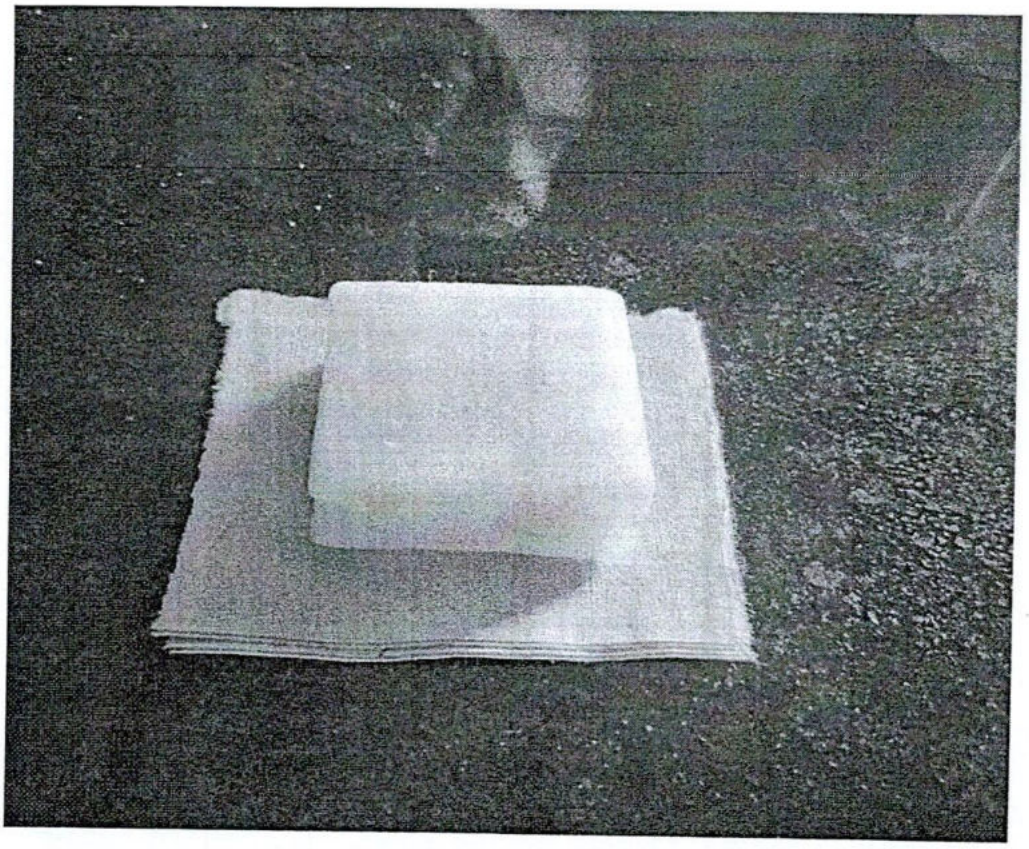

By mixture of coconut oil and aloe lemon juice and sodium hydroxide solution in proper ratio and heating the mixture followed by proper cooling we can get soap.

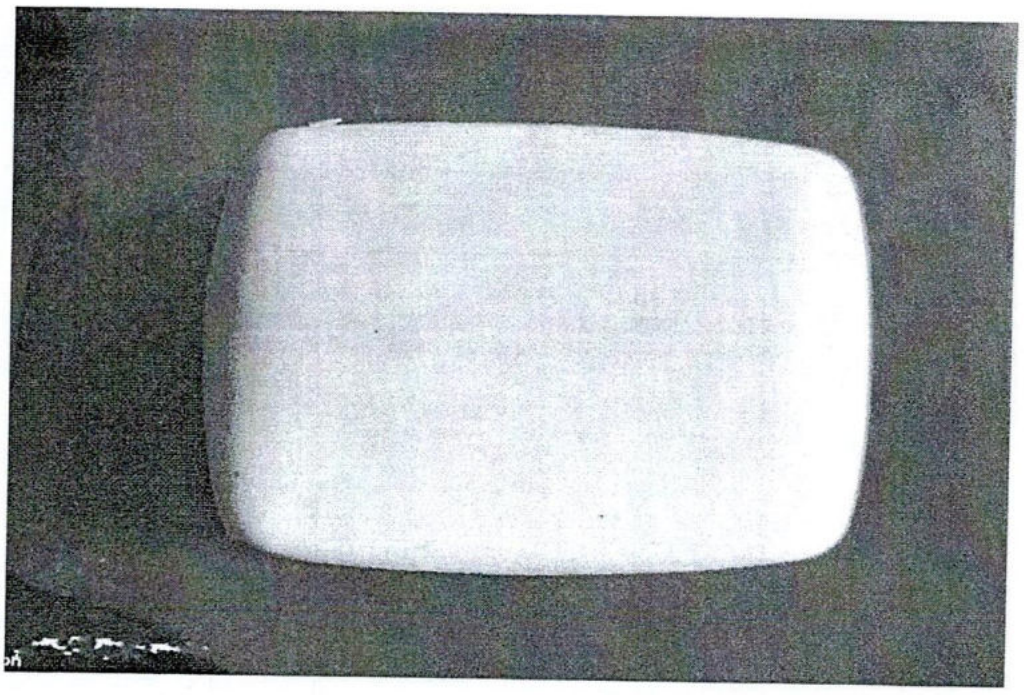

1. On heating and continuous stirring oil and sodium hydroxide solution, oil and water layers merge with each other.
2. This resulting mixture becomes thick which on adding common salt and on cooling forms a cake in moulds shaped
3. When a piece of this material is

Weight of lemon soap ;- 130gm

CHAPTER 5

IMAGES OF SOAP

CHAPTER 6

CONCLUSION

Soap was prepared using all varieties of oils including that of all the various blends of oils. The soap was tested for various properties and compared with detergents. One soap making oil in itself does not have all the properties

Soap is water soluble sodium salts of fatty acids. For making soaps, other than lemon soap, aloe Vera soap, we can also use many other fruits or natural ingredients. These soaps would have health benefits. Therefore these are natural cleansing agents having no side effects.

The soap is successfully prepared and the properties of soap are observed and recorded. The quantity of soap formed is depending upon the amount of regents used. The sodium chloride is used for the purpose of salting out and helps in crystallization of the soap. This procedure is applicable even in industrial setup.

1.6 Different types of soap making oils

Fats and oils are esters of different fatty acids and glycerol.Fats and oils are divided into three classes, fixed oils, mineral oils and essential oils. Fixed oils form the main raw materials for soap making as they decompose into fatty acids and glycerol when strongly heated, and can be easily saponified by alkali. Fixed oils, which include both animal and vegetable fats and oils, are further classified according to its physical properties as follows [13]:

a) Nut oils: These oils are characterized to be having large proportion of fatty acids with low molecular weight, especially lauric and stearic acid. Examples of these oils are coconut oil. These oils, when used in toilet soaps are the chief foam-producing ingredients.

They usually saponify easily with strong alkali solution. Once these oils have begun to saponify, the process proceeds rapidly with the evolution of heat. They require very large quantities of strong brine (1648"Be) to grain their soaps, and the grained soaps tend to carry more salt than other soaps. These oils are more suitable for the making of cold process soaps.

- **Hard fats**: The hard fats contain appreciable quantities of palmatic and stearic acids. Examples

of these oils are palm oil, animal tallow and hydrogenated fats. These oils produce slow-lathering soaps but the lather produced is more resistant over long periods of time than the nut oils. In soap making, they are first saponified with weak alkali, and in the final stages with stronger alkali solutions.

- **Soft Oils**: These oils have substantial amounts of unsaturated acids, namely oleic, linoleic and

linoleneic acids. The soap making properties of these oils vary with their fatty acid composition, and their physical and chemical properties of the acids. Examples of these kind oils are groundnut, cotton seed, fish oil and olive oil. These oils cannot produce a very hard soap when used alone for soap making. They are generally blended with nut oils. Their soaps lather freely and have very good detergent properties.

Soap making involves a definite chemical decomposition of fats and oils into their constituent parts, like fatty acids and glycerol. The fatty acids combine with little caustic soda, potash or other base forming soap, and glycerol remains free.

All fats and oils used in soap making consist of a mixture of compounds of glycerol with fatty acid which occur in nature in the form of triglycerides. The most important of these acids from the soap maker"s point of view are stearin, palmitin, olein and laurin. The presence of stearin and palmitin, which are generally solids at room temperature, gives firmness. The greater the

percentage present the harder the oil, and the higher its melting point. Where olein is liquid at ordinary temperature, is the chief constituent, the oil is soft.

The soap making properties of fats and oils can be determined by the molecular weights of their fatty acids. With increasing the molecular weight in the case of naturally occurring saturated fatty acids in fat or oil, the following properties are found

The properties of their corresponding sodium soaps vary as follows with increasing molecular weight:

- The solubility increases,
- The lathering properties improve up to lauric acid and deteriorate from lauric acid upwards,
- The stability of the lather increases,
- The detergent action decreases,
- The soaps have milder skin action as the series progresses,
- The property of holding filling solutions such as sodium silicate decreases.

This explains the reason why nut oil (such as coconut oil) soaps lather readily and profusely but not stably. They also have a firm texture and are hard but dissolve more readily in water than do soaps from the hard oils. They can also retain a good amount of water, and take up large quantities of fillers like sodium carbonate.

Chapter - 1

Introduction of Calcium

Calcium accounts for I to 2 percent of adult human body weight over 99 percent of total body calcium is found in teeth and bones. The reminder is present in blood, extracellular fluid, muscle, and other tissues, where it plays a role in mediating vascular contraction and vasodilation, muscle contraction, nerve transmission, and glandular secretion.

In bone, calcium exists primarily in the form of hydroxyapatite (Caw (PO4)6 (OH)2), and bone minerals is almost 40 percent of the weight of bone. Bone is a dynamic tissue that is constantly undergoing osteoclastic bone resorption and osteoclastic bone formation. Bone formation exceeds resorption in growing children, is balanced with resorption in healthy adults, and lags behind resorption after menopause and with again in men and women. Each year, a portion of the skeleton is remodelled (reabsorbed and replaced by new bone). The rate of cortical (or compact) bone remodelling can be as high as 50 percent per year in young children and is about 5 percent per year in adults (parfitt, 1988). Trabecular (or cancellous) bone remodelling is about five — fold higher then cortical remodelling in adults. The skeleton has an obvious structural role and it also serves as a reservoir for calcium.

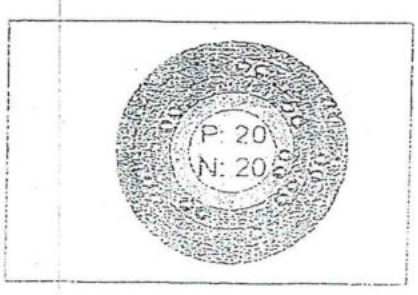

The group IIA of the periodic table contains the alkaline earth metals such as Ca, St, Ba and Ra. All the non metallic substances are insoluble in water and unchanged by five were called earths. Limes and magnesia showed alkaline reactions hence alkaline earths.

The name calcium is derived from latin word calas meaning lime was known as ear y as the first centuries when the ancient Romans prepared lime as CaO.

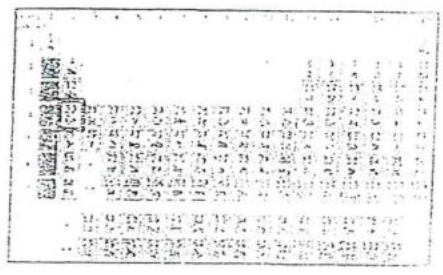

Atomic structure of Ca

II A Position of Ca in Periodic Table

Atomic structure of Ca

II A Position of Ca in Periodic Table

Properties of Calcium

The tensile property of calcium metal are greatly affected by impurities and in the pure form by the methods of fabrication. Calcium metal works upon mechanical possessing. Bulk calcium is soft, crystalline metal. It may be readily extruded on heating to 420 - 460°C. X-ray diffraction pattern of calcium samples exis s in only two allotropic form — face centered cubicand body centered cubic (464°C). according to Debye-Scherer, Ca exists in three allotropic modifications i.e. a-Ca-face centered cubic, 13-Ca-hexagonal close packed and y -Ca- body centered cubic. It readily forms awhite coating of nitrite in air, reacts with water by forming $Ca(OH)_2$, burns with ayellow red flame forming the largely the nitride. They are malleable, extrudable and machinable may be in rods, wires or plates. Calcium is cheapest of alkaline earth metals but more expensive than Sodium. Ca metal itself comates even in metallurgical work with some of its own compounds e.g. calcium silicide, calcium boride, calcium carbide, all of which are used as degasifiers, reductants and sources of calcium for alloys.

Physiological role

Daily body requirement is about 450 mg. The adult requirements of Ca vary. During pregnancy and lactation, there is greater depletion of Ca from the mother and the intake needs to be increased. On an average, 0 mg per kg of body weight per day should be sufficient.

The Ca play an important role to maintain some important body functions such as

i) Ca controls nerve excitability. The effect is mainly on the peripheral neuromuscular mechanism. Fibrillary twitching can be produced by per fusing a muscle with Ca free fluid. Automatic ganglia also become hyper irritable.

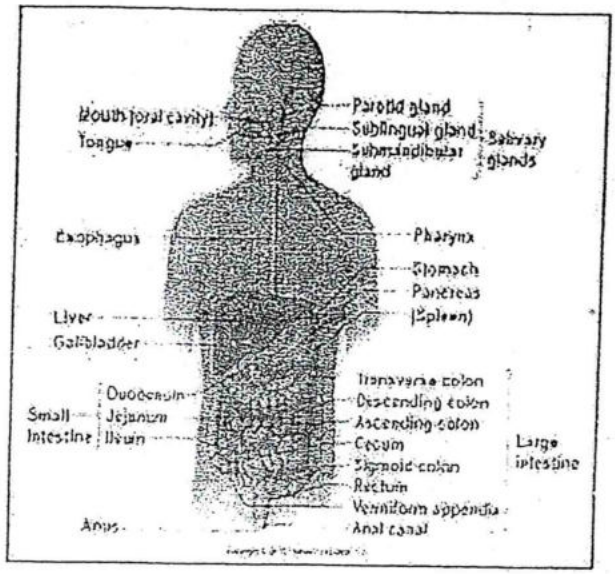

ii) it is necessary for the maintenance of the integrity of the skeletal muscles. An increase in the ionized Ca results in an increase in contractility and vice versa.

iii) It is very essential for maintaining the tone and contractility of heart. Ca is antidote to the depressant action of K.

iv) Tt aids rennin in the coagulation of milk in the stomach.

v) It is essential for the clotting of food. It decreases cellular permeability. It is therefore used in aliergic conditions to diminish exudation which produces wheals and rushes.Ca appears to serve as a constituent of the intercellular cement.

vi) Ca take part in the formation of certain tissues and bones. Normally 25 — 35% is excreted in the urine and the rest in the stools.

Calcium Deficiency

Calcium deficiency is a condition in which the body has an inadequate amount of calcium. Calcium is a mineral that is essential for many aspects of health , including the health of bones and also required for muscle contractions and relaxation, nerve and hormone function, and blood pressure regulation. Calcium must be ingested daily and absorbed effectively in order to maintain optimal health. Most people can get enough calcium by eating a variety of foods rich in calcium. Foods that naturally contain calcium include milk and other dairy products; green, leafy vegetables; seafood, nuts and dried beans. Calcium is also added to orange juice, breakfast cereals, breads, and other fortified food products .High dietary calcium intake is necessary for infants children and adolescents in orde to promote bone growth and formation. Pregnant women also have higher calcium needs, because it it required for the normal

development of fatal bones . In addition women who have reached menopause need to ensure an adequate amount of calcium intake to reduce the risk of osteoporosis.

Pharmaceutical Samples:-

Cipcal (250g),calotrack,selcal-500, calcimaxfort, MYCAL-D

Cipla ltd.

MRP:52.00 for 1 packet (5) (tablet each)

Composition

Vitamin D (12510) (calcium carbonate 625 mg)

Salt information

Vitamin D_3 (12510)

Typical usage :-

Vitamin D3 is used for the prevention and treatment of vitamin D deficiency.

Side effects of vitamin D_3 are uncommon these may include too much calcium in the blood (hypocalcaemia) or urine (hyper caliured) , leading to a feeling of sickness , loss of appetite: constipation, stomach ache , excessive thirst, muscle weakness, drownes or confusion.

Drug Interaction :-

When vitamin D_3 is used along with phenytoin, barbiturates or glucocorticoids, the effect of vitamin D_3 can be decreased . The effects of digitals and other cardiac glycoside may be increased when calcium is taken with vitamin D. Cholestyramine or paraffin oil may recue the gostrointes absorption of vitamin D.The anti-cancer drug actinomycin and drugs used to tread fungal infections may alter the vitamin D activity Always consult your physician for the change of dose regimen or an alternative drag of choice that may strictly be required.

Mechanism of action.

Vitamin D3 increases the absorption of calcium and phosphorous that are vital in forming and maintaining Strong bones. It is also required in regulating call growth and maintaining a healthy immune system

Calcium Carbonate (625 mg)

Typical usage.

To relieve the symptoms of indigestion, hearbarn, acidity and gases. **Side effects** :-

Constipation, burping, loss of appetite, dry mouth. Metallic taste, high levels of blood calcium, disturbance in the body's acid / base balance (alkalosis), changes in blood chemistry may lead to symptoms such as tiredness, irritable or stiff muscles or cramp and indigestion may occur after stopping the medicine.

Drug Interaction

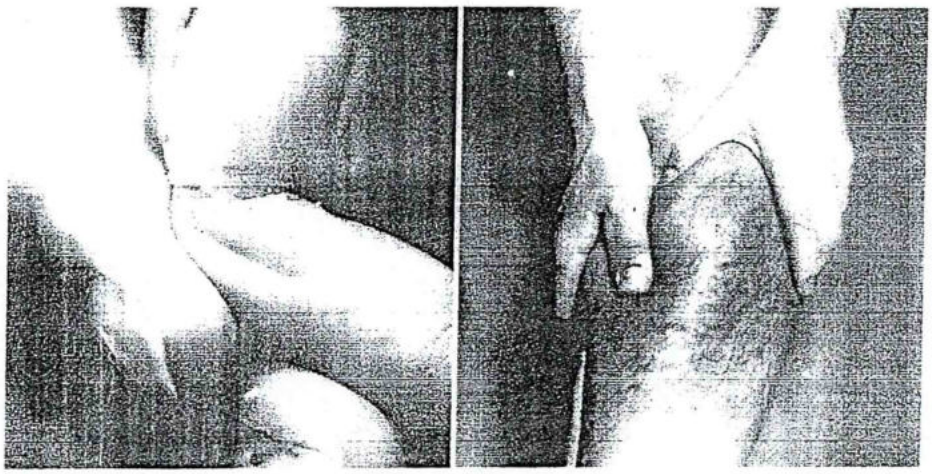

Takingcalcium carbonate with thiazide diuretics (bendroflumethiazide, hydrochlo-othiazide) or vitamin D may lead to high levels o..1 blood calcium and disturb the body's acid / base balance. Calcium carbonate may also integrative drug of choice that may strictly be required.

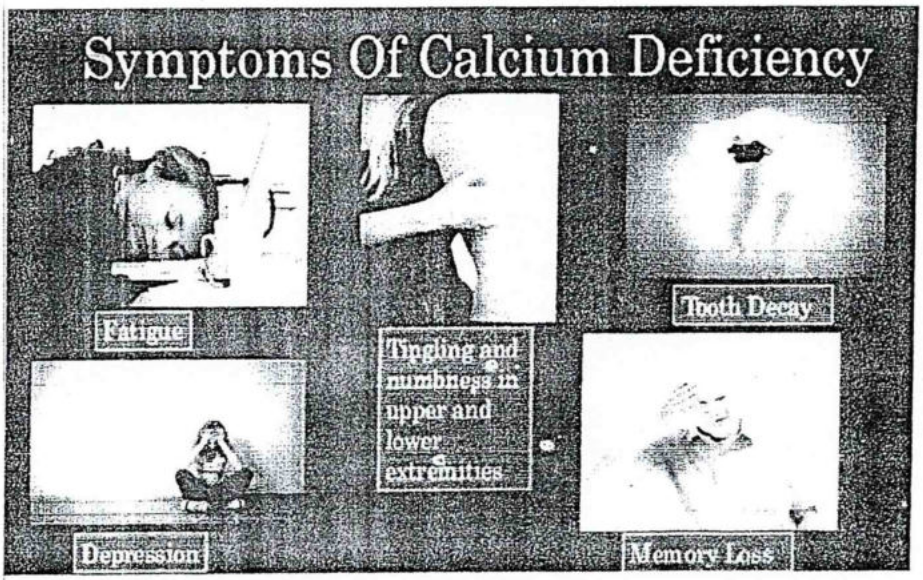

Mechanism of action.

Calcium carbonate is an antacid which neutralizes excess acid im the stomach.

Interactions:-

Can I take epical (25omg) during pregnancy / studies in animals have shown risk to feats. How're there are no sufficient studies in humans. This drug may be used in pregnant 200 men if benefit outweigh 45 the risk. Patients should follow the advice of the doctor regarding its use.

Chapter - 2
Analysis of calcium

Definition of Analysis:- The separating of any material or abstract entity into its constituent elements is called as Analysis.

Types of Analysis

Qualitative analysis

A qualitative analysis determines the presence or absence of a particular compound, but not the mass or concentration. By definition, qualitative analyses do not measure quantity.

Quantitative analysis

Gravimetric analysis

Gravimetric analysis involves determining the amount of material present by weighing the sample before and/or after some transformation. A common example used in undergraduate education is the determination of the amount of water in a hydrate by heating the sample to remove the water such that the difference in weight is due to the loss of water.

Volumetric analysis

Titration involves the addition of a reactant to a solution being analyzed until some equivalence point is reached. Often the amount of material in the solution being analyzed may be determined. Most familiar to those who have taken chemistry during secondary education is the acid-base titration involving a color changing indicator. There are many other types of titrations, for example potentiometric titrations. These titrations may use different types of indicators to reach some equivalence point.

Ethylenediaminetetraacetic acid

Widely abbreviated as EDTA (for other names, see Table), is an aminopolycarboxylic acid and a colorless, water-soluble solid. Its conjugate base is named **ethylenediaminetetraacetate.** It is widely used to dissolve lime scale. Its usefulness arises because of its role as a hexadentale ("six-toothed") ligand and chelating agent, i.e., its ability to "sequester" metal ions such as Ca^{2+} and Fe^{3+}. After being bound by EDTA, metal ions remain in solution but exhibit diminished reactivity. EDTA is produced as several salts, notably disodium EDTA and calcium disodium EDTA.

Complex titration with EDTA

EDTA, ethylenediaminetetraacetic acid, has four carboxyl groups and two amine groups that can act as electron pair donors, or Lewis bases. The ability of EDTA to potentially donate its six lone pairs of electrons for the formation of coordinate covalent bonds to metal cations makes EDTA a **hexadentate ligand.** However, in practice EDTA is usually only partially ionized, and thus forms fewer than six coordinate covalent bonds with metal cations.

Disodium EDTA is commonly used to standardize aqueous solutions of transition metal cations. Disodium EDTA (often written as **Na2H2Y**) only forms four coordinate covalent bonds to metal cations at pH values < 12. In this pH range, the amine groups remain protonated and thus unable to donate electrons to the formation of coordinate covalent bonds. Note that the shorthand form **$Na_{i_x}11,Y$** can be used to represent any species of EDTA, with x designating the number of acidic protons bonded to the EDTA molecule.

EDTA forms an octahedral complex with most 2+ metal cations, M^{2+}, in aqueous solution. The main reason that EDTA is used so extensively in the standardization of metal cation solutions is that the formation constant for most metal cation-EDTA complexes is very high, meaning that the equilibrium for the reaction:

$$M^{2+} + H_4Y \rightarrow MH_2Y + 2H^2$$

Role of indicator

Ferrochrorne Black T

I) It is a complex metric indicator that is part of the complex metric titrations

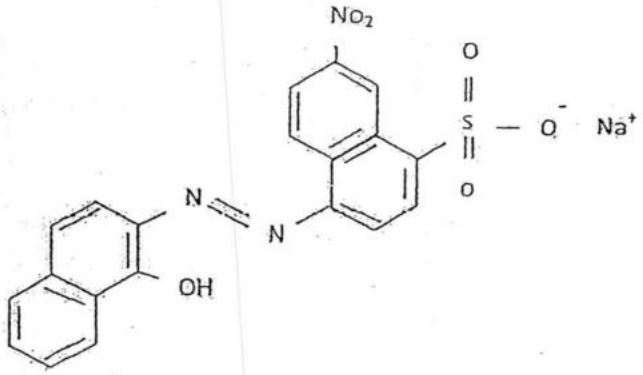

ii) In its protonated form, Ferrochrome Black T is blue. It turns red when it to forms a complex with calcium magnesium, or other metal ions.

iii)EBT is blue in buffered solution at pH lo. It turns red when Ca2+ ions are added

Definition Eriochrome Black T :-

It is a complex metric indicator that is part of the complexmetric titrations

Structure :-

IUPAC Name

Sodium 1-(I-hydroxynaphthylazo)-6-nitro -2-naphthol-4 - sulfonate

Systematic IUPAC Name :-

Sodium 4 — (2 (I- hydroxynaphfnalenz-y)hydrazine-I- ylidene) -7-nitro-3-oxo -3,4-dihydranaphthalene I- Sulfonate

CHAPTER-3

Experimental Procedure

Aim :- Analysis of Calcium in different pharmaceautical samples.

Apparatus :-Beakers, Burette, Measuring Cylinder , Volumetric Flask (100ml) , Whatmann Filter paper , conical flask, rod.

Chemical :- Tablets (Cipal & Calotrack,Shelcal-500, MYCAL-D, Calcimax-forte) ,EDTA solution (0.01m) , Ammonia Buffer solution (pH-10),Erichrome Black T indicator , Distilled water.

Procedure :-

1) A supplement tablet (Normally about 300 mg) of calcium ion was taken .
2) Then it is dissolved in minimum amount of water.
3) Then it is filtered & washing collected in 100 ml beaker.
4) It is diluted with 100ml Volumetric flask.
5) Several 2 ml sample of the tablet solution were titrated with 0.01 M EDTA solution.
6) Erichrome Black T indicator an dass one test tube of Ammonia Buffer solution is used in conival flask.
7) The mean corrected titration volume was observed.

For Cipcal Tablet :-

Observations :-

1) Weight of Cipcal tablet=300 mg= 0.300 g=0.0300×10^{-3}.
2) Solution in Burette = 0.01 M EDTA.
3) Solution in conical flask 2 cm^3 diluted sol^n +1 test tube Ammonia Buffer sol^n.
4) Indicator = Erichrome black T indicator
5) End Point = Wine Red to Sky Blue.
6) Reaction=

$$Ca^{2+} + EDTA^{-4}(aq) \rightarrow [Ca\ (EDTA)\ ]^{-2}$$

$$Kr = 5.0 \times 10^{10}$$

Observation Table :-

Readings	Burette Reading in cm^3			C.B.R in Cm^3
	1	2	3	
Final	**14.0**	**14.0**	**14.5**	
Initial	**0.0**	**0.0**	**0.0**	14.0 cm^3
Difference	**14.0**	**14.0**	**14.5**	

Calculations :-

$$\text{Mass of calcium (mg)} = \frac{\text{Volume} \times \text{Molarity}}{\text{EDTA (mg)} \times \text{EDTA}\left(\frac{\text{mol}}{c}\right)} \times \frac{1 \text{ mol of calcium}}{1 \text{ mol of EDTA}}$$

$$\times \frac{4.089 \text{ Clcium}}{1 \text{ ml calcium}} \times \frac{100\text{ml total Volume}}{2\text{ml sample Volume}}$$

(converts to g of Calcium) (converts to mg Calcium)

$$\text{Mass of calcium} = \frac{0.014 \times 0.01 \text{ mol}}{\text{Lit}} \times \frac{1 \text{ mol of } Ca^{2+}}{1 \text{ mol of EDTA}} \times \frac{40.089 Ca^{2+}}{1 \text{ mol } Ca^{2+}} \times \frac{1000 \text{ mg}}{1\ mg} \times \frac{100 \text{ ml total Volume}}{2 \text{ ml sample Volume}}$$

Mass of calcium = 0.014 x 0.01 x 1 x40.08 x 1000 x 50

= 280.54 mg

$$\textbf{\% of calcium} = \frac{280.54 \times 100}{0.300}$$

= 93.52

For Calotrack Tablet:-

Observation :-

1) Weight of Cipcal tablet=300 mg= 0.300 g=0.0300 $x10^{-3}$.
2) Solution in Burette = 0.01 M EDTA.
3) Solution in conical flask 2 cm^3 diluted sol^n +1 test tube Ammonia Buffer sol^n.
4) Indicator = Erichrome black T indicator
5) End Point = Wine Red to Sky Blue.
6) Reaction=

$$Ca^{2+} + EDTA^{-4}(aq) \rightarrow [Ca(EDTA)]^{-2}$$

$$Kr = 5.0 \times 10^{10}$$

Observation Table :-

Readings	Burette Reading in cm^3			C.B.R in Cm^3
	1	2	3	
Final	13.0	13.5	13.5	13.5 cm^3
Initial	0.0	0.0	0.0	
Difference	13.0	13.5	13.5	

Calculations :-

$$\text{Mass of calcium (mg)} = \frac{\text{Volume} \times \text{Molarity}}{\text{EDTA (mg)} \times \text{EDTA}\left(\frac{\text{mol}}{c}\right)} \times \frac{1 \text{ mol of calcium}}{1 \text{ mol of EDTA}}$$

$$\times \frac{4.089 \text{ Clcium}}{1 \text{ ml calcium}} \times \frac{100\text{ml total Volume}}{2\text{ml sample Volume}}$$

(converts to g of Calcium) (converts to mg Calcium)

$$\text{Mass of calcium} = \frac{0.0135 \times 0.01 \text{ mol}}{\text{Lit}} \times \frac{1 \text{ mol of } Ca^{2+}}{1 \text{ mol of EDTA}} \times \frac{40.089 Ca^{2+}}{1 \text{ mol } Ca^{2+}} \times \frac{1000 \text{ mg}}{1\ mg} \times \frac{100 \text{ ml total Volume}}{2 \text{ ml sample Volume}}$$

Mass of calcium = 0.0135 x 0.01 x 1 x40.08 x 1000 x 50

= 280.54 mg

$$\textbf{\% of calcium} = \frac{270.54 \times 100}{0.300}$$

= 90.18%

For Shelcal -500 Tablet:-

Observation :-

1) Weight of shelcal-500 tablet=300 mg= 0.300 g=0.0300 $x10^{-3}$.
2) Solution in Burette = 0.01 M EDTA.
3) Solution in conical flask 2 cm^3 diluted sol^n +1 test tube Ammonia Buffer sol^n.
4) Indicator = Erichrome black T indicator
5) End Point = Wine Red to Sky Blue.
6) Reaction=

$$Ca^{2+} + EDTA^{-4}(aq) \rightarrow [Ca(EDTA)]^{-2}$$

$$K_f = 5.0 \times 10^{10}$$

Observation Table :-

Readings	Burette Reading in cm^3			C.B.R in Cm^3
	1	2	3	
Final	10.4	10.5	10.5	10.5 cm^3
Initial	0.0	0.0	0.0	
Difference	10.4	10.5	10.5	

Calculations :-

$$\text{Mass of calcium (mg)} = \frac{\text{Volume} \times \text{Molarity}}{\text{EDTA (mg)} \times \text{EDTA}\left(\frac{\text{mol}}{\text{c}}\right)} \times \frac{1 \text{ mol of calcium}}{1 \text{ mol of EDTA}}$$

$$\times \frac{4.089 \text{ Clcium}}{1 \text{ ml calcium}} \times \frac{100\text{ml total Volume}}{2\text{ml sample Volume}}$$

(converts to g of Calcium) (converts to mg Calcium)

$$\text{Mass of calcium} = \frac{0.0105 \times 0.01 \text{ mol}}{\text{Lit}} \times \frac{1 \text{ mol of } Ca^{2+}}{1 \text{ mol of EDTA}} \times \frac{40.089 Ca^{2+}}{1 \text{ mol } Ca^{2+}} \times \frac{1000 \text{ mg}}{1\ mg} \times \frac{100 \text{ ml total Volume}}{2 \text{ ml sample Volume}}$$

Mass of calcium = 0.0105 x 0.01 x 1 x40.08 x 1000 x 50

= 210.42 mg

$$\textbf{\% of calcium} = \frac{210.42 \times 100}{0.300}$$

= 72.14%

For MYCAL-DTablet:-

Observation :-

1) Weight of MYCAL-D tablet=300 mg= 0.300 g=0.0300 $x10^{-3}$.
2) Solution in Burette = 0.01 M EDTA.
3) Solution in conical flask 2 cm^3 diluted sol^n +1 test tube Ammonia Buffer sol^n.
4) Indicator = Erichrome black T indicator
5) End Point = Wine Red to Sky Blue.
6) Reaction=

$$Ca^{2+} + EDTA^{-4}(aq) \rightarrow [Ca(EDTA)]^{-2}$$

$$Kr = 5.0 \times 10^{10}$$

Observation Table :-

Readings	Burette Reading in cm^3			C.B.R in Cm^3
	1	2	3	
Final	10.9	11.0	11.0	
Initial	0.0	0.0	0.0	10.5 cm^3
Difference	10.9	11.0	11.0	

Calculations :-

$$\text{Mass of calcium (mg)} = \frac{\text{Volume} \times \text{Molarity}}{\text{EDTA (mg)} \times \text{EDTA}\left(\frac{\text{mol}}{c}\right)} \times \frac{1 \text{ mol of calcium}}{1 \text{ mol of EDTA}}$$

$$\times \frac{4.089 \text{ Clcium}}{1 \text{ ml calcium}} \times \frac{100\text{ml total Volume}}{2\text{ml sample Volume}}$$

(converts to g of Calcium) (converts to mg Calcium)

$$\text{Mass of calcium} = \frac{0.011 \times 0.01 \text{ mol}}{\text{Lit}} \times \frac{1 \text{ mol of } Ca^{2+}}{1 \text{ mol of EDTA}} \times \frac{40.089 Ca^{2+}}{1 \text{ mol } Ca^{2+}} \times$$

$$\frac{1000 \text{ mg}}{1\ mg} \times \frac{100 \text{ ml total Volume}}{2 \text{ ml sample Volume}}$$

Mass of calcium = 0.011 x 0.01 x 1 x40.08 x 1000 x 50

= 220.44 mg

$$\textbf{\% of calcium} = \frac{220.42 \times 100}{0.300}$$

= 73.48%

For Calcimax-forte Tablet:-

Observation :-

1) Weight of Calcimax-fort tablet=300 mg= 0.300 g=0.0300 $x10^{-3}$.
2) Solution in Burette = 0.01 M EDTA.
3) Solution in conical flask 2 cm^3 diluted sol^n +1 test tube Ammonia Buffer sol^n.
4) Indicator = Erichrome black T indicator
5) End Point = Wine Red to Sky Blue.
6) Reaction=

$$Ca^{2+} + EDTA^{-4}(aq) \rightarrow [Ca(EDTA)]^{-2}$$

$$Kr = 5.0 \times 10^{10}$$

Observation Table :-

Readings	Burette Reading in cm^3			C.B.R in Cm^3
	1	2	3	
Final	11.8	12.0	12.0	12.0 cm^3
Initial	0.0	0.0	0.0	
Difference	11.8	12.0	12.0	

Calculations :-

$$\text{Mass of calcium (mg)} = \frac{\text{Volume} \times \text{Molarity}}{\text{EDTA (mg)} \times \text{EDTA}\left(\frac{\text{mol}}{c}\right)} \times \frac{1 \text{ mol of calcium}}{1 \text{ mol of EDTA}}$$

$$\times \frac{4.089 \text{ Clcium}}{1 \text{ ml calcium}} \times \frac{100\text{ml total Volume}}{2\text{ml sample Volume}}$$

(converts to g of Calcium) (converts to mg Calcium)

$$\text{Mass of calcium} = \frac{0.012 \times 0.01 \text{ mol}}{\text{Lit}} \times \frac{1 \text{ mol of } Ca^{2+}}{1 \text{ mol of EDTA}} \times \frac{40.089 Ca^{2+}}{1 \text{ mol } Ca^{2+}} \times \frac{1000 \text{ mg}}{1\ mg} \times \frac{100 \text{ ml total Volume}}{2 \text{ ml sample Volume}}$$

Mass of calcium = 0.012 x 0.01 x 1 x40.08 x 1000 x 50

= 220.44 mg

$$\text{\% of calcium} = \frac{240.48 \times 100}{0.300}$$

= 80.16%

CHAPTER -4

Results :-

1) The Mass of Calcium in Cipcal Tablet = 280.56 mg
2) The Mass of Calcium in Calotrack Tablt = 270.54 mg
3) The Mass of Calcium in Shelcal-500 Tablet = 210.42 mg
4) The Mass of Calcium in MYCAL-D Tablet = 220.44 mg
5) The Mass of Calcium in Calcimax –forte Tablet = 24048 mg

CHAPTER -5

Conclusion :-

It conclude that Mass of Calcium ion in **Cipcal** tablet is about 93.52 % and 280.56 mg % also in **Calotrack** tablet Mass of calcium is about 90.18 % and 270.54 mg & also in **Shelcal -500** is about 72.14 % % 210.42 mg And also in **MYCAl –D** 73.48 % & 220.44 mg & in **Calcimax –forte** is 80.16 %240.48 mg. It is observed that Mass of calcium is different in different tablet is in different volume.
