

26 July - International Day for the Conservation of the Mangrove Ecosystem

Mangroves: The Boon of Nature

Mangroves are intermediate landform lying in between land and sea. Those are halophytic plants which can tolerate saline water logged condition. Because of their high salt tolerance, Mangroves are among the first life forms which colonize mud and sandbanks grow along with coasts and estuaries. Mangroves provide foundation for growth and development of other organisms. They provide habitat for variety of terrestrial as well as coastal communities and protect them from wind, waves and floods.
